The History of Calypso: The Era of Space Travel (full)

Ages ago, when the first international space stations for scientific research were constructed in orbit around the planet Earth, the era of space travel began and thrived on the increasing knowledge of how humans could adapt and live comfortably in space. When this knowledge was needed to solve the practical technological solutions for a life in space, the task was given to any corporation interested in such development. This eased the financial pressure on international space projects. As a result space became a giant open market for all commercial interests.

For both scientific and commercial gain, Man sought to set foot and claim the nearest planets in his own solar system this led him into an era of interplanetary conquest. The public interest for space together with its commercial value pushed space development onwards and the people of Earth experienced a virtual space-craze.

Orbital hotels around Earth became very popular resorts. A permanent station, half way to the moon, was constructed to allow shuttle traffic to a permanent base on the moon. A larger space station was later constructed in orbit around Mars to prepare the planet for colonization and it didn't take long before both the moon and Mars became the most populated new settlements away from Earth. Space cruising adventures, hotel resorts on both the moon and Mars became vacation franchises. These space resorts combined scientific research with corporate excavations for new resources, and the construction of these mines and refineries pushed the development of new space age technology forward. All this advanced technology would help Man adapt to the new environments and allow him to expand his horizons even further. Mankind had taken the final step into space.

When resources began to be depleted on Earth and harder environmental laws were being issued to prevent global ecological disaster, the world industry felt compelled to find new resources away from Earth and create new industries in space. Using probes and automated mining facilities run by computers and robots their investments would pay off. The need for smarter machines spurred research and development into artificial intelligence. Companies and scientists constructed advanced space probes to scan space and its celestial bodies for new data and resources. Space became a brand new expanding market for production and kept the global economy in balance. As a result corporation felt compelled to merge and form new and more financially powerful space corporations in order to compete for these precious new resources.

With leading market interests in space set into motion, it led to increased scientific research and the rapid development of new technology. One of the most important scientific and technological revolutions during this age was the development of Quantum Technology. This technology offered lightning speed computer processing and was used to create the first super AI computers, which in turn led to the manufacture of truly intelligent robots. It also brought a new form of instant global and interplanetary communication, which sent signals through a series of relays and beacons called a hyper link transmissions network. This technology would later allow humans to send matter through time and space by means of teleportation, which would become the key to future interstellar travel.

The complete knowledge of the human DNA allowed for genetic alterations to the human body. Although held under heavy restriction, laws to control genetic engineering would allow experiments to help humans adapt to different environments on alien planets in the future. As a result science created the androids, organic humanoid robots engineered from biological materials that could be programmed and tested as virtual copies of real human beings. Due to the advanced knowledge

involved in the creation of androids these artificial humans were only used in restricted scientific research. The androids could never topple the less expensive and practical use of standard robot technology that became available to all after the development of the new AI computers.

Even though signal transmissions had become instant within the solar system the physical means of travel was still quite primitive. Fusion Engines could take space vessels to the colony on Mars in a few months and make it to the furthest planet in the system within three years. It was good enough for efficient interplanetary travel but not practical for human interstellar journeys. Unmanned robot probes that were equipped with this type of propulsion were sent out on endless voyages into deep space and could take a hundred years before reaching even the nearest star. Finding a habitable planet for humans at this rate could take more than a thousand years. Mankind had to settle for the planets that were within reasonable reach inside its own solar system.

The History of Calypso: The Conquest of Space

As interplanetary travel grew the space frontier quickly shrunk because it was limited to the inner boundaries of the solar system and the early ways of space travel. New resources became rare and conflicts between rival corporations grew more violent in their desperate struggle to claim any new resources. The fear of a global economical collapse due to a slow stagnation of the interplanetary market, and the threat of an open armed conflict between the leading national corporations would soon compel Mankind to find ways to reach even deeper into space, far beyond their own solar system. To solve the growing economical problems the leading global forces within politics, market and science moved together to embark on the greatest enterprise in human history: the Odysseus Project. As this huge endeavor was set into motion the gathered forces within this new global body also took the final step towards a world union.

Though the market industry was to be the main beneficiary from the Odysseus Project, the public also had to be convinced that they were part taking in a great historical enterprise as well. Many conservative emerging nations worried that they could be left out so the plan to increase the industrialization and knowledge of space would also include a mission to expand the whole human civilization beyond its own solar system and to secure the survival of Mankind in the future. This would be Mans Greatest Quest". Taking advantage of a project of such a grand scale it was used to give a feeling of new hope to the world, and calm the masses. As a result the New World Project was founded along side the Odysseus Project and its main goal was to find a new planet in a nearby solar system that could sustain human life. But to send humans beyond their own solar system and directly into the unknown infinite voids of space was still too dangerous. The journey was far too long, the search extremely difficult and the construction of life-supporting spacecraft made the enterprise both technologically and financially crippling. Instead combined efforts and resources were focused on the development of new technology, such as the Jump Rail, Shield Generators and the creation of Antimatter.

The first step towards the development of teleportation technology was the invention of a linear way of teleportation using a construction called a Jump Rail, which was capable of sending matter light-years away straight across space. However, construction and usage was extremely costly and the journey far too inaccurate and risky to be of any real practical use. The amount of material, special constructions and energy consumption needed to create a Jump Gate were not available at the time to make it viable. With the creation of antimatter and prototype antimatter reactors it was possible to construct the first functional Jump Rail, though it was still far from practical. The mere fact that the Jump Rail would be torn apart by the violent forces released at each launch did not help its case. For a vessel to survive the immense stress of a launch it seemed natural to focus on the construction of small , compact vessels. The first tests were performed on so called nanoships, and even though the stress tests proved minimal during launch, the smaller vessels did not survive the

actual journey. These tests proved that the target matter needed to be contained within a powerful energy field to prevent its atoms from dissolving. As a result the technological development of energy shields also took a step forward. All new technology at this early stage of development was quite crude in both size and functionality. The task required a vessel with a much larger and sturdier hull, allowing it to be equipped with all the devices needed as well as the massive surrounding construction that could emit a stable energy field to protect it. Worried about loosing political momentum the new global political body changed project requirements so that all the new bulky equipment would have enough space onboard the new vessels: the giant Odysseus Probes…

A total of seven large Odysseus probes were assembled on orbital space stations. Jump Rails was then used to launch the probes into space towards carefully selected planetary star systems in the galaxy. These star systems had proved to be the most suitable candidates according to prior astrological research with the most advanced space telescopes and equipment. The probes had to be completely self-reliant and were therefore equipped with the most advanced and expensive technology available at that time. Each probe was controlled by a virtually sentient AI quantum super computer, which made the probe capable of its own progressive development and self-reproduction. The AI had several objectives and two primary missions. One was to find and utilize new resources, launch new probes and prepare a communication network for Mankind in space. The second mission was to find a planet capable to sustain human life and initiate a terra-formation to prepare it for human colonization. When a probe had reached its target destination it launched drones to make a survey of all nearby stellar constellations, in search of potential resources to exploit in order to continue its own reproduction and primary mission directives. When enough data have been gathered on a potential planet the probe would send down a Base Matrix that was to land on a strategic place on the planet, set up a base platform and begin to construct it's own robots. Well adapted to the environment these robots would in turn find and extract necessary resources from the surrounding areas and produce material to build new facilities. To expand the base and increase its technological capabilities, the Odysseus probe would monitor the progress to a certain point before it would continue its journey towards a new destination. The base would continue to expand and eventually launch a new generation of Odysseus Probes into space to continue the primary missions.

The further development of Quantum Technology led to the construction of the first functional teleportation units, which allowed all matter to travel virtually instantly from one place to another. It also meant that organic matter could be transferred from one point to another, creating an instant form of human travel. From being just scientific experiments the new technology needed stronger financial support from the market to reach up to the next levels of development. The Global Alliance saw a great potential in the system and financed the next step in the development: the creation of the first global teleportation network. With financial benefits in mind the scientists introduced the idea of creating an open doorway through space that would save a lot of travel time between colonies and remote outposts. Since the large "Quantum Leap Generators" in each system required vast amounts of energy to function it ultimately led to the increased research and development of antimatter reactors and refineries. With practical and profitable use in mind the technology would later be used to create the first operational Space Gates in the future.

All Odysseus Probes had been built and launched within the period of a decade. During this time the newly formed global alliance had to deal with arising conflicts in order to protect their goals towards a unified world. But with new technology at their fingertips the alliance was able to end all major conflicts as quickly as they arose, and not always by the use of force. To add more strength to their agenda they made the teleportation technology available to the open market. When teleportation became the new way of public transportation it made daily trips and global travel quick, easy and available to everyone. As a result the national borders begun to gradually fade away and merge together, increasing the human tolerance and slowly erasing the cultural barriers that had

kept mankind apart. Ethnical groups, political factions and a strong sense of cultural heritage still remained within human society but as Earth was becoming one world it was each individuals affiliation to one of the growing global mega-corporations, which replaced the old human view of having different nationalities on Earth. Meanwhile the people on the expanding interplanetary colonies gradually became more socially integrated, slowly forming a stronger bond to each other and the planet they lived on…

The History of Calypso: The New Order

The people of Earth were about to unite under one single form of leadership. But the corporations were growing weary from waiting for the new resources and profits that the Odysseus probes would bring them. After nearly a decade there had still been no response from any of the Odysseus Probes and people feared that the probes had been destroyed. With each year passing by without a message from any of the probes the conflicts in space increased and before long escalated into corporation wars. The battles took place in space far away from Earth where the Global Alliance had no means of control. With the lack of response from the Odysseus Probes and the brewing conflicts in space beginning to spread to the Mars colony, it increased the official demand for answers as well as the need for new leadership. Scientists came up with the conclusion that the probes had been caught in some sort of a temporary abnormality that became known as a Time Flux, probably due to the form of travel provided by the use of Jump Rails. Half teleported and half travelling at several times the speed of light it would change the reality of time from both standpoints. What would appear like a short moment of travel for each probe could pass by like ages for the people back on Earth. Still, it was only a matter of time before the project command central would receive the first signal of arrival from one of the Odysseus Probes. In the meantime corporation conflicts had to be dealt with using a stronger power than what could be issued out by the Global Alliance.

The Global Alliance was determined to take control of the situation before the conflicts escalated on Mars and stop them before they could spread to the Lunar Colony and finally the Earth itself. To gain enough power to take action the Global Alliance gathered to form a whole new government. This new form of leadership would gain political power to rule the Earth, including all the planets in the solar system and all regions of space in-between them. But most important, it would also stretch as far as human civilization went, no matter how far away into space it would take Mankind. The Federal Empire of Earth had been born.

The newly formed Federal Empire used political tactics and increased mobile military capabilities in space to gain control over the interplanetary colonies. This was done in order to prevent the corporation wars spreading down to solid ground and into populated areas. Time was short and the Federal Empire wished to put an end to the corporation wars before the first signals from the Odysseus Probes were received. The first elected Supreme Imperial Chancellor did not intend to give the corporations the chance to slip away and take their conflicts with them to any new colonies in the future front regions of space. When the corporations lost control of the public markets their armed conflicts quickly came to an end. For a short time the corporations thought about forming their own alliance, which threatened to turn against the Federal Empire in an attempt to overthrow its new government. However, during the very same period the first signals from one of the Odysseus Probes reached Earth. The growing threat from the corporations quickly faded away as they turned their interest towards the new potential resources that were beginning to emerge across space. This first signal was the start of a new age in the history of Mankind: the era of interstellar travel and conquest.

The History of Calypso: The Colonization of Space

Decades passed by as Mankind began to move away from Earths solar system, following the

growing web of robotic bases and industrial supply facilities that were left behind by the Odysseus Probes. So far, the Jump Rails were the only means of interstellar travel but this would soon change with the invention of the Space Gates. As the industry continued to expand the public community would follow and it became a slow but natural form of immigration out into space. Humans managed to adapt and overcome the problems of a life in colonies on new alien worlds, learning how to survive in very hostile environments.

Communications and travel were easy but life was hard, if not impossible, unless science and technology were used to aid Mankind in the stellar conquest and colonization of new planets. Even though many worlds are considered habitable it still requires advanced environmental and/or anatomical adjustments to support human life. As a result many humans on far away worlds have been altered technologically or genetically and have become altered in their appearance compared to the original humans on Earth. Through the passing of generations these altered humans have began to naturally inherit genetically engineered traits from their parents, without the need for prior genetic alteration of the unborn child. As for yet, the only aliens encountered have been relatively early forms of primitive life. The altered humans originating from Earth remain the only truly intelligent form of life on these few habitable alien worlds.

With the continued development of Teleportation Technology the first operational Space Gates were soon being constructed across the entire Earth solar system to link the different planets and colonies together. There was no longer a need for any large human transport vessels between the interplanetary colonies since smaller shuttlecrafts could now travel instantly through the Space Gates. However, the Space Gate technology had its limits. An active gate consumes vast amounts of energy and requires the large scale construction of antimatter reactors, generators, shields, stabilization units and other expensive systems. The opening itself in the gate has to be kept small to keep the active teleportation field stabile and the passage secure. The reactors that generate the energy to activate a gate are enormous and require large quantities of antimatter to function. The creation of antimatter is still a difficult and expensive process, still making the issue of Space Gates a matter of economics rather than the most practical and efficient way of space travel available.

The interstellar network is growing rapidly. To encourage market competition and ease the economical strain, as well as the political pressure from having to sway off corporate mischief towards the government, the Federal Empire began to issue out Imperial Contracts. These contracts focus on the communication network such as the protection and maintenance of Hyper Link Beacons and the construction of Space Gates. Corporations who have obtained a contract to maintain a beacon are able to pick up new signals transmitted from an Odysseus Probe that has established a new base somewhere in space. The signal that is crossing a contracted beacon will be detected and tagged with a claim before the news has reached all the other control station in the network in each sector of space. The corporations are then able to sign the contract for a new base and its resources from the Federal Empire at first hand. This also includes claiming a contract for future research and the development of entire new colonies on other planets, which is called a Colonial Contract. This means that the corporation is in complete control of the market on the colony until the whole world has been terra-formed and secured to allow a larger public immigration.

The History of Calypso: The Beginning

Centuries had passed by as man slowly moved further into space. During this time an unknown number of new generation Odysseus Probes had started their endless voyage cross the galaxy, sharing the same ancient quest as the original seven probes that had been launched from Earth such a long time ago. It was one of these new generation probes that discovered a truly life-giving planet. With minor environmental adjustments this New World would be a virtual copy of the Earth itself

but with its own evolution of generally early primitive life forms. Once the probe had proven the environment to be acceptable for human settlement it established a base and sent a message back through the hyper link network before it begun the terra-formation of the planet. When the atmosphere and environment had been adjusted to fully support human life the robots continued to build cities that were to stand ready in time for the first human arrivals.

However, things had changed during the course of time since the first original probes were launched from Earth. Before the signal managed to reach its intended destination on Earth, it was intercepted and decoded by a corporation that now owned and maintained several of the beacons inside a large sector of the hyper link network were the signal was first received and identified by humans. The corporation OmegaTech quickly claimed the contract to colonize the world but withheld the crucial information from the public that a true living planet had been discovered. The issue was only discussed in secrecy before the Supreme Imperial Chancellor within the closed chambers of the Imperial Senate. The Federal Empire knew the great importance of this historical discovery and decided to give the contract to OmegaTech along with an ultimatum. Unless the corporation had begun a colonization of the planet within a decade the Colonial Contract would be passed on to the next corporation in line that filed a claim on the New World after it had been made official. Indeed there were speculations that the Federal Empire itself had already drawn up its own plans and that the ultimatum was only their first step in taking control of the New World...

As the data communications with the robot base matrix on the New World continued more data was decoded that revealed new amazing information. According to certain files the mysterious planet had kept the Odysseus Probe stationed for several standard cycles in orbit before it finally made the decision to leave, despite available resources to construct a new Jump Rail to continue its own voyage within less than one cycle. Any information that would explain this event had for unknown reasons never been transferred from the Odysseus Probe to the robot base matrix before the probe left the star system. This strange delay in the probe's voyage gave the planet its name according to a very ancient human tale from Earth, were a sea nymph waylaid a homeward-bound hero named Odysseus for seven years on her island. The name of this nymph was Calypso and it was considered most fitting for a future market campaign.

Despite efforts to keep the discovery a secret many rumors of the amazing New World soon begun to spread across the colonies. The new planet and its star system were positioned far past the rim of the Colonial Frontier, which gave the isolated planet an almost mystical reputation amongst the people on the imperial colonies as well as on Earth. This growing public interest was building up a pressure on both the OmegaTech Corporation and the Federal Empire. OmegaTech used this interest to execute a hostile takeover and to gain legal motion and financial aid from the Federal Empire for a daring project that would expand the empire outside the colonial boarders and past the known frontiers by bringing the first human settlers to Calypso.

With federal aid and a growing public interest throughout the colonies, OmegaTech were able to launch an enormous enterprise called the Exodus Project. Its goal was to bring human settlers to Calypso within less than a decade. The best way would be to launch a research ship towards Calypso using a Jump Rail. The ship would carry necessary equipment and crew for the construction of a Space Gate and the basic material needed to link it to its counterpart that would be built inside the secure space of the colonial frontier. However, there were not enough technological resources available within the corporation itself to embark on such a project. To succeed with this endeavor OmegaTech would need to obtain technological aid and resources from other interstellar corporations but the space market was more interested in seeing the downfall of OmegaTech rather than to help it succeed and prosper. It was a clear attempt by market rivals to weaken OmegaTech in order to move in later and take over the financially vulnerable corporation. High prices on imported resources, shipment delays, equipment flaws, espionage and sabotage would threaten the project, despite legal aid from the Federal Empire. The Federal Empire wasn't able to control the

corporations directly in favor of a single corporation without a risk of causing a political market crisis. OmegaTech had foreseen this line of events and decided to use a more old fashion approach to overcome this problem.

By contemplating whatever available technology and resources it had access to the corporation decided build a giant colonial space vessel called The Exodus. The commercial campaign was given the same name as the ship, which increased the public interest in the project even more. The Exodus would be able to take over a thousand settlers to Calypso using the largest Jump Rail ever built. With financial support from the Federal Empire the project was set into motion, despite massive criticism from rival corporations about the low technological level of the whole enterprise. And it was a risky business. It would take every last bit of financial resources to succeed, which would leave the OmegaTech Corporation financially crippled and very vulnerable.

The colonies on other planets were not considered living planets like Earth. Even though some planets possessed enough basic elements to be terra-formed and given a new designed ecosystem it still had to be artificially maintained, just like the home planet of Earth itself. Despite these advanced technologies permanent habitants had to be genetically designed to survive on these worlds. Calypso had its own natural ecosystem, even though it had been slightly altered by the robots to make it perfectly suitable for unaltered human beings. When the Federal Empire stated that the discovery of the New World was fact, it quickly became leading news all across the colonial empire. The thought of an untouched world spread a new sense of hope and joy amongst the people throughout the colonies. The Exodus campaign rose ill rumors amongst the colonies that the New World would only be available to the unaltered human elite on Earth and the people within the OmegaTech Corporation, which caused industrial strikes and colonial uproars. The relatively small colonial communities of altered humans posed more of an annoyance than a threat to the corporations and the Federal Empire. The colonial uprisings would fade away with the insurance that the Federal Empire would give all people in the colonial empire the chance to apply for the journey to Calypso onboard the Exodus. However, genetically altered humans and habitants on other colonies wouldn't be anatomically fit to take on the hard ventures as settlers at this early stage of colonization. Instead they were given the official promise that they would gain access to the new world as any other visitors would once the colony had been secured. This promise was not favored well amongst certain political fractions and would result in a growing envy and ill will within the altered human colonies...

The Exodus was built in space inside a shielded dome next to a large resourceful asteroid and industrial facilities owned by the OmegaTech Corporation. This dome was not only a shipyard but would also serve as the protective coating around the ship when it was to be launched by the large Jump Rail. The Jump Rail was being constructed at the same time near another resourceful asteroid. These construction areas were located not far away from a central space station that controlled the only Space Gate in the sector. When the great ship was complete, it was moved to the Jump Gate and there it was prepared for launch. The fortunate people who had been authorized to become the first settlers on Calypso were now allowed to travel to the space station and board the Exodus. Every step in the project was followed in detail by the interstellar media and transmitted through the interstellar hyper-link network, instantly reaching people all over the colonial frontier inside the Federal Empire. Media titled it "The Great Exodus", which boosted the public campaign even more. When the Exodus ship was finally launched on her journey towards Calypso it was considered as another milestone in human history and the beginning of a new era. It had taken three years to complete the Exodus Project but it would take another two years before the people in the Federal Empire finally heard from the Exodus again.

The History of Calypso: The First Arrivals

When the first settlers arrived on Calypso everything was prepared for their arrival by robots that had already built up a complete infrastructure. Upon the settlers arrival, the robots Base Matrix turned over its control to the humans. The first settlers on Calypso experienced a historical moment as they sat foot on a vast and unspoiled planet, rich in life and resources. They moved into the cities and began to make the last adjustments to the environment. Mankind seemed to have returned to paradise and this first region of colonies became known as New Eden. But all this would soon change...

During further investigations of the Robot Base Matrix on Calypso the research teams were never able to find the reason why the Odysseus Probe had stayed for so long before leaving. Though the reason for this delay would remain a mystery the researchers did come across several clues that pointed towards another nearby star system, positioned even further away in the unknown regions of space. The scattered information indicated that shortly after a robot base had been successfully established on Calypso, the Odysseus Probe had constructed a new Jump Rail and then launched itself towards this new destination. Its last transmission was made only to inform the Base Matrix that the probe had arrived and positioned itself in orbit around one of the major planets inside this system. For all they knew the silent Odysseus Probe could still be there.

The OmegaTech Corporation decided to launch a second project called Operation Prometheus in an attempt to shed more light over the mysterious actions of the Odysseus Probe. It would also be an opportunity to intercept and examine this old human artifact from the past. An unmanned probe named the Prometheus 1 was prepared for the mission and a small Jump Rail was built to launch the probe towards the last received coordinates. Equipped with a hyper-link transmitter it could send back instantaneous information of what it might discover. The probe arrived at its intended destination in less than three months and transmitted data of an eerie and dark planetary system orbiting a dying star. Two colossal planets with high-density readings were the most distinct features in the system and were given the names Akbal and Cimi. There was no sign of the Odysseus Probe but Prometheus 1 had detected signals from several robot base installations on the surface of both these planets. There was no doubt that these robots originated from the Odysseus Probe, but the question was why the Robot Base Matrix hadn't established any communications with the interstellar hyper-link network. As Prometheus 1 was ordered to establish contact with the Base Matrix on the planet Akbal the research team back on Calypso received several encrypted signals through its system that originated from the Robot Base Matrix on Akbal. Unable to decode it they decided to process it through the Base Matrix on Calypso...

The History of Calypso: The Robot Uprising

Without any warning the Base Matrix turned all its robots into savage and ruthless death-machines, and with cruel and merciless tactics, forced the darkest era known to Man upon the poor settlers of Calypso. At the beginning of the revolt the Base Matrix cut off all forms of communications on and off the colony. It took control of space drones that were working on a near completed Space Gate and used them to sabotage the construction, rendering it completely useless. The terror continued as it overloaded local energy reactor facilities in the cities, causing them to overheat and explode. It intended not only to destroy the infrastructure but also spread lethal radiation poisoning that would quickly dispose of all living human beings. A few colonies managed to stop this sabotage in time and people quickly became organized in time to stop the local robots from running berserk inside their cities. But the Base Matrix had already planed to take advantage of the panic and confusion to create an armed army of restless robots that would turn the revolt into total war.

As the humans were forced to retreat the sinister robots begun to use own nuclear charges to infect possible escape routes and wipe out any last scattered remains of the human population. This

massive radiation would slowly kill more people over a longer period of time, but many settlers survived this contamination. Instead of dying they were genetically altered and perhaps suffered a far more cruel fate than death. They began to mutate. Only a few uncontaminated survivors managed to seek refuge in the last city left standing on Calypso and get transported up to the orbiting Exodus but only genetically unaltered humans were welcome here. There was simply no room or resources left in the city for medical care and safe treatment of these victims. For the protection and the survival of the human refugees inside the city the severely contaminated humans were rejected and forced away. They only managed to survive by hiding in the wilderness and underground in the city ruins to escape the robot death-machines. What little humanity they had left slowly faded, with no hope of ever being rescued. They were doomed and quickly forgotten by the humans who were too occupied with their own survival.

Mad robotic space drones caused damaged to the Exodus in orbit but its internal AI computer systems remained secure. The ship and its crew survived the ordeal and managed to clear the space of all hostile elements. The Exodus was then transformed into an orbital military space station and the crew initiated a rescue operation to evacuate as many human survivors as possible from the surface. Surviving settlers had to be turned into soldiers and would be forced to fight long and hard to reclaim their planet but they were being constantly outnumbered by the robots. Since all AI robots were being infested with the same madness down on the surface the commanders onboard the Exodus could not send in its own robots to battle in fear that these machines would go mad as well and be used against them. In a desperate attempt to even the odds the commanders onboard the Exodus begun to create androids and used these artificial genetic humanoids as expendable soldiers and personnel in the war. They also started to use semi-automated drone ships, piloted by human operators onboard the Exodus using a remote hyper-link control system. To reestablish contact with the Federal Empire the Exodus crew used a small Jump Rail to launch a probe past the jamming range of the robot infested planet and managed to connect itself to the interstellar hyper-link network and send a message of their desperate situation back to the Federal Empire. The next step was to rebuild the Space Gate but they could only spare enough antimatter to activate the gate for a very limited period of time. Once the Space Gate was activated they could only hope that there would be reinforcements standing by on the other side...

The situation on Calypso was clearly getting out of control. To quickly deal with this growing problem the Federal Empire of Earth forced OmegaTech to sign over the entire corporation leadership to the imperial government, thus forming the federal controlled imperial corporation now known as OmegaTech Incorporated. This federal incorporation gave OmegaTech access to more funds and resources that could insure the safety and future prosperity of the colony on Calypso. When the corporation became federal the planet also became an open market for other corporations to make future investments. The Federal Empire welcomed any help that could present an immediate aid to the settlers in their struggle for survival. According to the message the settlers could only keep the Space Gate open for a short moment. A massive military operation to save the colony could not be launched with such limitations so the only efficient form of aid would be a compact delivery of the latest technology, supplies, equipment and expert personnel. Any corporation that offered their aid would be given the first share of the new open market on the colony. As a result brand new technology would become available to the settlers such as Resurrection units, Mindforce and Energy Weapons. Calypso would be turned into a test zone for many new technological wonders...

The cry for help from Calypso was the primary issue of debate in all the political chambers back on Earth. One of the primary concerns was to insure that the robotic madness wouldn't spread to any other robotic outposts or to any human colonies. The second concern was to help the settlers on the isolated colony on Calypso. Besides sending immediate technological aid, the Federal Empire constructed Jump Rails to launch several military spaceships towards Calypso as a back-up plan if

the settlers failed to recapture the planet. Although it was agreed that it would require a larger military operation to perform such a task, the Colonial Chamber made it clear that no imperial or company-controlled paramilitary force could be stationed on Calypso after such an operation. It would diminish their trust towards the Federal Empire since the members of the Colonial Chamber feared that such military force would be used to keep colonial people away from the planet in the future. The colonial people would never accept Calypso being turned into an "Imperial Resort" for the citizens of Earth, giving that there was a planet left after such a full scale military operation. Many feared that such a presence of military power might escalate the robot attacks to such a degree that it could lay waste to the entire planet...

The settlers and crew onboard the Exodus had fought hard to defend the last populated region of the colony. Only three cities inside this region had escaped robot sabotage and destruction because they had been built around a large inactive volcano, relying solely on geothermal energy absorbed from deep within the sleeping mountain. The other cities used matter/antimatter reactors, which proved to be their downfall as the robots used these to create large explosions that levelled the cities and spread a lethal radiation poisoning amongst the human survivors. The protected region was to become known as The Haven. It was the only tactical and secure area left on the planet and many survivors who had fled from the other cities came here to seek refuge. It was the last line of defense and the only chance for Mankind to recapture the planet and defeat the robots. The settlers withstood the robot attacks long enough to successfully repair the Space Gate and create a temporary opening. Personnel of officers, scientists and engineers from the Federal Empire were rushed through the gate along with as much supplies and equipment as possible before the gate closed. In a desperate attempt to keep the poorly stable gate open as long as possible it collapsed and exploded. The colony was cut off again but they now had new technology and expertise at their disposal, which finally gave the colonial forces enough military strength to fight a winning battle against the robots.

Despite the advantage of the new technology it would take several hard years before the robots could finally be defeated. The brave settlers withstood the robot terror long enough for imperial military vessels to arrive at the Calypso system with more reinforcements, and the war came to an end. To inspire new hope among the settlers, the Federal Empire declared that a whole new infrastructure would be created in the three remaining cities. To ease the financial strain on federally owned corporation OmegaTech Inc, the Federal Empire decided to give two other interstellar corporations access to Calypso. These new corporations would aid the colony in the construction of the other two city projects in exchange for a higher market position within these assigned urban zones. Each corporation was also assigned a contract by the Federal Empire to exploit different resources on the planet in order to insure stability and to encourage trade and economical growth within the region. These three new cities were named New Haven, Neo Ithaca and Xin Shi. But the war was far from over...it had only just begun.

When the robots had been destroyed it gave the settlers on Calypso a short moment to reflect on what really had caused the robots to rebel and target humans as their enemy. The element that caused the catastrophe was soon traced back to its point of origin, in the Akbal-Cimi system. When the Imperial military spaceships were being prepared for launch towards the Akbal-Cimi system a massive vessel arrived in the Calypso system along the very same trajectory. The vessel clearly came from the Akbal-Cimi system and it was soon identified as an Odysseus Probe. The massive vessel was not responding to any commands but it was most likely to have been the very same Odysseus Probe that once discovered Calypso. The only form of messages transmitted by its AI command module were said to be incomprehensible but were taken as a warning to the settlers, later revealing its real intent, to recapture the planet. The imperial military spaceships were quickly positioned to intercept this first Titan of War and prevent it from reaching Calypso. The battle over Calypso lit up the dark skies at night for several days before the massive Odysseus Probe was

finally destroyed and its wrecked parts fell through the atmosphere like shooting stars. One military spacecraft and nearly all of its crew had been destroyed and the rest of the small fleet suffered substantial damage. The Exodus was kept safe and out of harms way on the other side of the planet during the battle - in case the settlers had to be evacuated from Calypso. This historical moment became known as the Battle of Calypso but it never became a celebrated victory. To the settlers the battle only meant the beginning of a new robot war...a war that has yet to end...

The History of Calypso: The Robot Threat

Communications with the robots were properly reestablished after the first war but the victory faded quickly as the news on the Battle of Calypso reached all the colonized corners of the Federal Empire. The speculations of an interstellar threat of mad Odysseus Probes turning back to conquer human colonies spread much fear on the Colonial Frontier. As a result the colonies on the frontier demanded increased military protection from the Federal Empire. To avoid panic and rebellion the Federal Empire ordered its imperial fleets to be stationed in the colonized sectors positioned close to the distant sectors of the Calypso and Akbla-Cimi systems. A small fleet of imperial spaceships were also sent to join the battered fleet in the Calypso system in preparation for an offensive strike against the very heart of the robot problem. However, by moving forces from one corner of space to another it weakened the Empires presence and power in certain sectors, causing colonies to seize the moment and gain enough political power to make the people rise up and demand imperial independence. This threat to the Federal Empire postponed any further reinforcements of new spaceships to Calypso, since these vessels are considered vital to stabilize the current conflicts that had arisen within the empire itself.

Naturally the Federal Empire would not redraw their imperial battleships currently deployed in the Calypso system. The Federal Empire also kept their word to the loyal colonies that it would not station any imperial military command or forces on Calypso, which assured the colonies future as an open market for any new investment. The task to uphold law and order as well as the defense of the colony has been given to the local authorities and the Colonial Guard. The Federal Empire maintained command of the solar system space defense. The rest it laid in the hands of the settlers themselves.

To keep the planet safe from further robot invasions a solid orbital defense system had to be constructed before all else. In order to release enough resources for this purpose all other projects on rebuilding the colonial infrastructure on Calypso were postponed. Funds have only been focused on rebuilding one single city: the city of New Haven. OmegaTech constructed a basic network of orbital energy emitting satellites, which included deep space detectors, patrolling drone ships and drone carriers. By constantly expanding the Orbital Defense Network it created an impenetrable planet defense system for the future. The original plan was to use this network as a defense against asteroids but it was now reworked to include five times as many units. A built-in safety system in every unit guaranteed that none of the offensive orbital weapon systems could be armed and directed towards the planet itself. The entire defense network is connected to the Exodus, which now served as an orbital command central.

After several failed attempts to penetrate the defense network on Calypso the Akbal-Cimi Base Matrix seemed to realize that it would take far too much time and resources to break through the increased orbital space defenses around Calypso before its own system would be invaded by counter-attack forces. It kept building new modified Odysseus Probes but kept them stationed in the close vicinity of the Akbal-Cimi system for protection. Unmanned scout probes from the fleet in the Calypso system were sent out to investigate the Akbal-Cimi system and soon discovered that a similar defense network was already being constructed around the main planet of Akbal. Soon these scout probes wouldn't even get that close to the Akbal-Cimi system as the robots began to deploy

their modified Odysseus probes, now called Titans of War by the Imperial Fleet, and position them further out in the system to form an own first line of defense. At this rate it would no longer be possible to recapture the Akbal-Cimi system with the currently available resources or technology within the Calypso system.

It became obvious that the robots had access to far superior technology when armed groups of robots somehow managed to penetrate the orbital defenses and suddenly began to appear on the surface of Calypso. It took some time before it became clear that the robots truly did just appear out of thin air. Somehow the Matrix on Akbal-Cimi had managed to reveal the secrets of true dimensional travel and used it to develop a superior form of teleportation technology, thereby being able to construct a fully functional deep space teleportation system. The robots were now able to deploy and teleport their troops across time and space and drop them down directly on the surface of Calypso. Although fewer in number these new robot invaders were far better constructed and equipped compared to their predecessors that once ran amok on Calypso. Their mission was as clear as ever: to destroy all humans and take over the planet.

As the robot threat increases, Imperial Fleet of Calypso has come to realize that an attack on the corrupt robot home world, the Akbal-Cimi system, would be impossible since the robots now possess a superior technology and nearly infinite resources. It makes the robots far too powerful compared to the forces of the Federal Empire and an attack on their planet would be a virtual suicide. When the problem was brought before the Imperial Chamber it decided to change strategy and made up a new and far more controversial plan. They believe that if given enough time, the robots will continue to develop and deploy new technology with their invading forces. Upon defeating these new robots that technology can be recovered and extracted in order to increase the research and technological development of Mankind. This conquered robot technology will then be used to create new weapons against the robots, weapons that some day will finally defeat the raging machines once and for all. In short, the superior ability of humans to adapt and invent things by both logic and abstract thinking will sooner or later put them side by side with the robots, flexible but strictly logical minds. In the end it will bring Mankind the tools they need to put an end to the robot war and regain control of Calypso and the Akbal-Cimi system. It was considered the most likely entropy for the planet according to a simulation of the problem performed by GAIA, the Global Artificially Intelligent Advisor and likewise the imperial central super computer on Earth. This also gave the controversial plan its official name: Project Entropia.

The downside of this entropy is that the robot invasion of Calypso has to continue in order to obtain the crucial knowledge required to finally liberate Calypso from the robot menace. Something that is not favored too well by the settlers on Calypso, but it's something they now have to learn to live with. The land once called "New Eden" now felt like a painful memory of a paradise lost long ago and the authorities changed it to Old Eden. However, being struck by a sense of dark humor in their hard and lonesome struggle against the restless robot invaders, the local citizens of Calypso like to refer their small pocket of human civilization as the Land of Entropia.

This is the present time.

The History of Calypso (summary)

A long time ago Mankind took the final step into the depths of space. We conquered our own solar system and soon embarked on a new era of interstellar travel. Mankind have now begun to expand their civilization across the galaxy, following a growing web of desolate outposts and industrial supply facilities that have been left behind by robotic space vessels called the Odysseus Probes.

The Odysseus Probes was a great enterprise set into motion by a global alliance that would later unite the people of Earth. For nearly a century these Odysseus Probes have explored and expanded Mankind's knowledge of space and its endless new frontiers, continuously discovering new planets and primitive worlds to which humans have later arrived to colonize and conquer. During the dawn of this new era of interstellar travel the Earth have survived the conflicts and transitions to a centralized form leadership that tied every colonized planet together into the Federal Empire. One of these new colonial planets is called Calypso, a life-giving but remote world in a star system situated far beyond the Colonial Frontier in the deep unknown regions of space.

The Odysseus Probe that discovered Calypso built up a vast robot community to prepare it in time for the first human arrivals. One single corporation made the first claim to colonize the world and launched an enterprise called the Exodus Project to bring the first settlers to the New World. When the first humans finally arrived to Calypso they could move in to several pre-constructed cities in a terra-formed region of the world called New Eden.

As the settlers moved in the robots would turn over the control to the humans. It was during this gradual human takeover that something went terribly wrong. The robots suddenly turned against the settlers and started a devastating war that would become known as the Robot Revolt. This war nearly wiped out the entire human population on Calypso and laid their new colonies in ruins. After a long time a new generation of settlers finally rid the planet from the hostile robots only to face a new menace as horrid mutated humans began to emerge among the radioactive ruins. Rejected and forgotten, this new threat was quickly set aside by the settlers when they discovered a new robot enemy suddenly appeared from the dark void. The enemy had not been eliminated and was now originating from elsewhere. A desolate robot controlled mining colony in far away star system has been infested with the same corruption as the robots did on Calypso. These new robots are real war machines, and they are now trying to invade Calypso using advanced teleportation technology to land their invading forces directly on the planet.

And so, the war against the machine continues. The colonial catastrophe on Calypso forced the corporation in charge to be signed over to the Federal Empire. The benefit of unlocking a free market on Calypso was overshadowed by the bureaucratic behemoth of the Federal Empire. Growing tensions between collaborating colonies that are demanding more independence from the Federal Empire has diverted military resources away from Calypso. The free market provides access to vast technological aid but the settlers are now left to deal with the invading robots on their own. It's a part of an imperial plan called Project Entropia, which is based on the calculated presumption that salvaged enemy robot technology will provide the settlers with the knowledge they need to surpass, strike back and finally defeat the robots once and for all.

Despite all the dangers that are threatening the colony on Calypso the settlers are determined to persist and have built up a colonial capital called New Haven. This is the first new striving social community on the planet, built to provide settlers with a secure home environment as they continue to explore and colonize the expanding planetary frontier in the land of Entropia.

Animals of Calypso

Allophyl

Class: Unclassified

The Allophyl, also known as the "Fisherman", is one of the strangest native animals on Calypso. It's extremely tall, but despite this size, its body is very light, allowing its long and slender legs to support its own weight. The Allophyl is a marine animal and lives near the waterside were it primarily feeds on fish and other water animals. Its hunting technique varies from searching the sea bottom to catching free-swimming prey in the water, but its method remains the same. It uses sensitive electrodes on its tentacles to locate the prey, which it then stuns it with an electric charge released into the water between its two slender tentacle arms.

The flying Igni insects are sometimes seen hovering around these majestic animals, hoping to extract some of the residue energy from the electric charges that are released while the Allophyl is hunting.

Armax Bull

Class: Xenosaur

This is a large male xenosaur equipped with an impressive armament of horns, thick plate armor and a club on the end of its tail. Its full scientific name is Armaxenosaur and it's an herbivore that feeds on any type of vegetation, even in barren landscapes were it uses its tusks to dig for water or roots.

The bull walks alone or as the sole leader of a small group of Armax cows. Alone it's quite peaceful but when it's with a herd it will defend its cows at all cost and become very aggressive.

Armax Cow

Class: Xenosaur

This is a large female xenosaur. Its armament might not be as impressive and effective as that of the Armax bull, but it's still very capable of defending itself. The full scientific name of this herbivore is Armaxenosaur. It feeds on any type of vegetation, even in barren landscapes were it uses its tusks to dig for water or roots.

The Armax cow rarely ever walks alone and is most often found in small groups with other cows lead by a large bull. Its natural enemies are carnivorous xenosaurs.

Atrax Dino

Class: Xenosaur

Also known by its more correct scientific name Atraxenosaurus, the teeth and double set of jaws on these vicious xenosaurian carnivores are made for killing and tearing flesh apart. With such a massive bulk they are capable of stalking and striking down prey much larger than themselves. Thankfully, these powerful predators rarely hunt in packs, at least not the grown adults who usually hunt alone or in pairs. Younger and less experienced siblings are known to hunt in small family groups for a period before reaching a mature age. Equipped with sharp night vision, they usually hunt under the cover of night, which is why they're also known by a more sinister nickname - the Dark Dinos.

Daikiba

Class: Xenomammalien
Habitat: Forests

The Daikiba is a very large and massive animal. Its appearance is distinctive: a large head with two huge saber tusks. Despite its fearsome appearance, it's an herbivore and mainly uses its large tusks to dig up roots or peel bark from trees in order to feed on their soft centers. The tusks are also used as weapons when fighting predators. Its thick leathery hide offers the animal good protection, especially from it's own kind during the tough mating seasons.

Both males and females use their tusks for fighting off rivals, fending for themselves and defending their mates and young. The Daikiba form pairs and family groups, but can also live in scattered herds to benefit from the increased awareness and protection provided by their numbers. As a result, the Daikiba have relatively few natural enemies to worry about.

Occulus

Class: Unclassified

This alien looking creature has five tentacle legs and a round body with only one distinct eye. It's capable of using mental powers and has a strong defense against the human Mindforce. The Oculus maintains itself in an upright position with special glands filled with methane gas. One of these glands can be seen like a red bulge on its swollen head, which serves as a pressure vent. The glands allow the Oculus to hover like a balloon, using its sucker-equipped legs to cling on to the ground for faster movement. Without a good foothold it will float away, which it also utilizes to glide through the air.

The gas glands also work as a natural deterrent against predators who find the stench repulsive. Any weapon that might ignite the gas will in most cases cause an explosion if the Oculus is severely injured.

It's uncertain what the Oculus feeds upon to sustain itself, but it's clear that it likes decaying matter. This has given it several nicknames, like the "Rot Pod" or the "Harvester of Decay". Methane gas from decomposing material is most probably its main source of nourishment, which it can extract using its tentacles.

Sabakuma

Class: Xenoinsectopod

The Sabakuma, also known as the "desert demon", is a crawling sandworm with big vicious fangs. It seems to inhabit all known deserts on the planet where it hides from other predators or digs itself down to lurk beneath the ground. Its hunting methods vary but usually it patiently awaits its prey to pass over it on the surface before it strikes. This animal is also quite fast and agile and will resurface to give chase to a promising prey. Its thick scaly body provides it with good protection but it's no good against the powerful beak of its natural enemy, a creature known as the Longu.

Snablesnot, Male

Class: Unclassified

This is a bipedal creature with characteristically long and muscular trunks extending from its round body. The Snablesnot is referred to as a relatively harmless predator that feeds on insects. It uses its trunks for many things: to keep its balance, as grip organs, mouths and for hunting its main prey. It attracts large flying insects with its own body stench, and then shoots them down with a load of sticky and corrosive yellow slime from its trunks, thereby immobilizing them and turning them into easy pre-digested pickings on the ground. The rest of its body has evolved very differently in comparison to the much larger female Snablesnot, but they still share their characteristic set of limbs.

Snablesnot, Female

Class: Unclassified

The female Snablesnot is a large and bulky quadruped. It has two long and massive trunks, used as grip organs but which also function as two mouths, adding even more to its overall length. The rest of its body has evolved very differently in comparison to the much smaller bipedal male Snablesnot. The female Snablesnot is referred to as a relatively harmless predator that feeds on low vegetation. Leafs and weeds are torn off and sucked up into the trunk were they are dissolved by a lair of corrosive slime before reaching the belly. It's able to shoot sticky green slime as well as concentrated clumps of acid from its trunks, but it primarily uses these methods to defend itself from attacking predators.

Igni

Class: Xenoinsectopod

This bug belongs to a special breed of strange alien insects called the Igni. They all share the same unique metabolism, which allows them to feed on energy and store it in their bodies. This makes them very energetic to say the least, and they need to be. Their lack of legs indicates that they remaining in flight all their

life after they hatch.

What's even more fascinating is these insects ability to emit energy for defensive or offensive purposes. All Igni insects are attracted to various natural and artificial energy sources, which they feed upon. This niche in nature gives them a very good natural resistance against any type of energy that could otherwise be harmful. There are several different kinds of Igni insects, each one with it's own distinct form of energy emission. It's easy to tell them apart by their color and size. The Red Igni for instance can generate a burning heat ray of concentrated energy, similar to a laser blast.

Pupugi

Class: Xenoinsectopod

This is a large flying green insect. It belongs to an aggressive breed of different xenoinsectopods that have long scorpion-shaped rear bodies, ending in a big poisonous sting. The sting is very sharp and the lash it can make with its rear body is powerful enough to cut through thick hides. Smaller preys are killed by lash cuts rather than by the poison, while larger prey risk falling victim to a much slower death.

The female Pupugi insects kill larger animals with poison in order to lay eggs in its carcass. The female then ferociously guards this nesting ground against any scavenger who might try to feed on the dead animal. Most predators can sense these nesting carcasses and will usually turn away and find their food elsewhere.

There are several different kinds of Pupugi insects, each one with it's own niche and habitat. It's easy to tell them apart by their size and color. The Green Pupugi is the most common breed and lives in various forms of green vegetation.

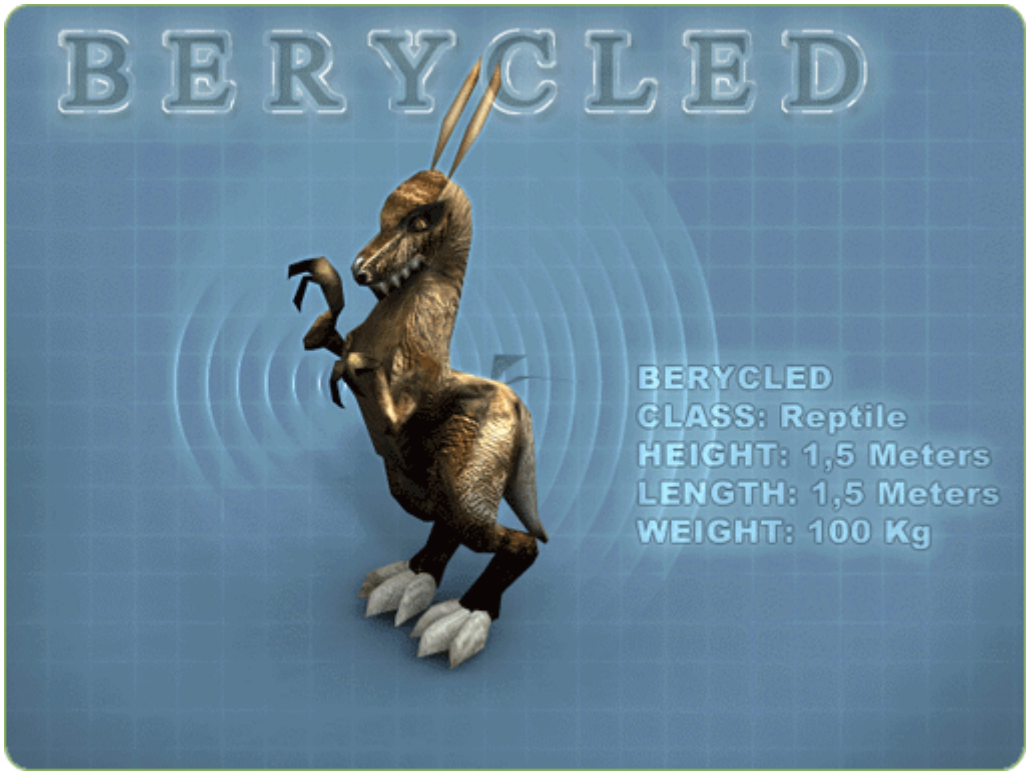

Tripudion

Class: Xenosaur

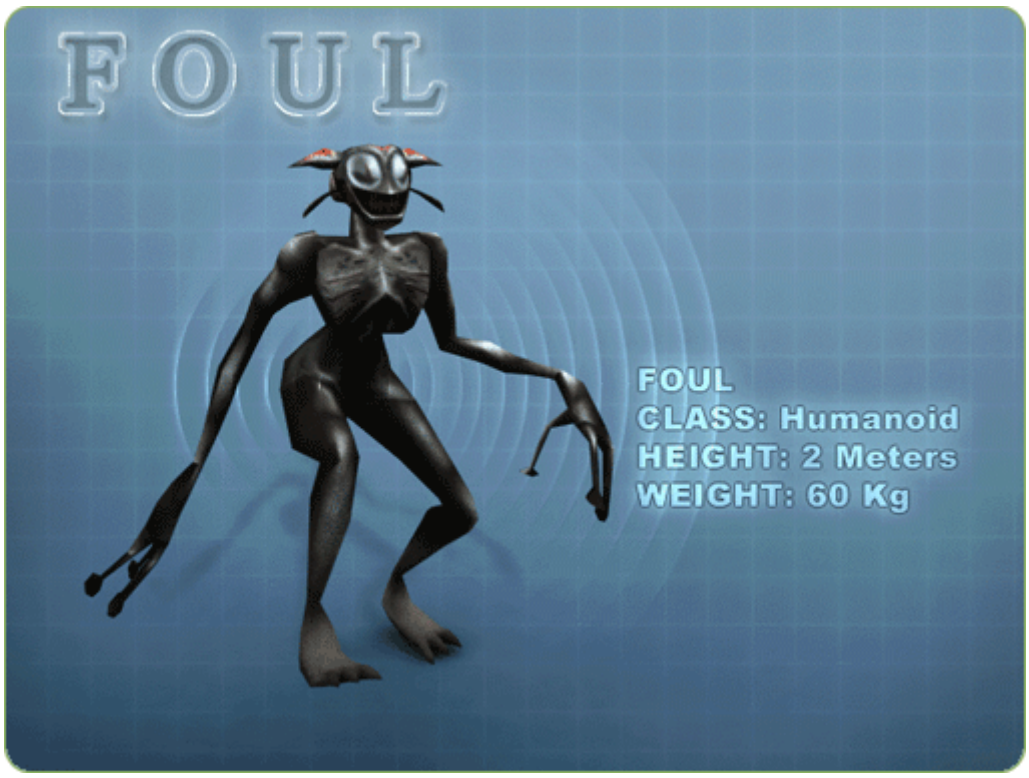

Sometimes referred to by its nickname "skipper", this is a large and fast moving quadruped predator. Its supple limbs allow for amazing agility and movement. It normally settles for smaller and quicker prey like flying insects, which its most fit to hunt. Despite this, it's still an aggressive animal.

This is the Argonaut, one of the strongest and most dangerous creatures. No-one knows where they come from, but there are rumours that they come from hell and followed the first pioneers to Calypso.

Funny looking creature, looks like on of those carnalval-horses you find on Earth. Don't let his looks fool you, it can do some big damage...

Weird creature, it has large hands and is very flexible. An adult Foul can have the ability to attack from large range with MindForces much like the ones we use.

The Gazonk, also called "Target Practice". They have almost no defence and aren't very fast. They form the basic food of predetors and of course of the humans. Luckily the poor things breed like rabbits.

Lady's and Gentlemen, meet the Hiryuu! This giant flying reptile is also called "the flying dragon". Its very strong and when pissed off he will attack everything that moves.

The Katang looks alot like a wild pig on Earth, it's flesh is very tasteful and in packs they can proove to be dangerous.

The Molisk. Usualy friendly creatures unless you piss them off, their claws are designed for hacking in rock so they might as well hack in armor.

The Mutants were once humans, they were among the first pioneers that went to Calypso. After the robots used Nuclear devices in the Robot-Revolt they didn't die but were geneticly alterd. We assumed they died after a while but somehow they managed to survive, now they form one of the biggest threaths to humans on Calypso.

This is the Neco Insect, one of the many big insects you'll find on Calypso. They usualy hunt in packs and should be considerd extremly dangerous.

Corporations

Genesis Star Interstellar

"Masters of Progress"

Genesis Star Interstellar is a relatively young but very ambitious company, remaining alert to any opportunity that may present itself. The corporation relies on a quick wit and raw strength to get what they want, a trait that can sometimes make them seem aggressive and somewhat reckless. For Genesis Star hesitation means loss and any failure is quickly covered up by a success elsewhere. They are considered to be very anti-imperial and like to blame Omegaton Industries for illicit federal support that would cause market unbalance had it not been for their presence on the planet.

Unverified rumors claim that the Federal Empire gave Genesis Star access to Calypso because they give quick results, thus encouraging the other corporations to increase their own rate of planetary development. Indeed Genesis Star finished their initial part of the imperial contract before all the other corporations. The Federal Empire saw this as proof of their strength and a clear signal to the other two dominant corporations that Genesis Star Interstellar is a very competitive force to reckon with.

Quotes made by Genesis Star about:

Chikara OmniWorld: "Silence doesn't mean wisdom, it's just a sign of hidden weakness."

Omegaton Industries: "We'll watch you squirm in the imperials claws till you choke, and when they are done with you we'll be there to pick your bones and help scatter your ashes."

Genesis Star: "We have risen from the ashes of the past to burn as bright as a guiding star into the future."

Chikara OmniWorld Corporation

"The power to shape worlds"

Chikara OmniWorld Corporation is a very stringent and powerful organization. It's renowned for its firm stance on solid ground and is proud of its long business tradition. They value the traits of wisdom, discipline and honor, which result in their strength and stability. Their standing and power allows them to be patient and observant, which can sometimes makes them seem rather slow in taking initiatives but when they act, they act with great force in the right place and at the right time.

The seniority of the mighty corporation helps to insure a peaceful community on Calypso, even though its presence is strongly opposed by Genesis Star Interstellar. Some refer to it as yet another clever diversion by the Federal Empire to keep political activity within the Genesis Star administration at bay, a rumor Chikara OmniWorld officials have chosen not to comment on.

Quotes made by Chikara OmniWorld about…

Genesis Star: "A stubborn child needs to be observed by wiser eyes"

Omegatech Industries: "Loyalty is only a virtue if it's equally respected by both sides"

Chikara OmniWorld: "Power in itself is worth nothing unless you know how to harness and control it."

Omegaton Industries

"Enlightens your Mind"

Omegaton Industries is known as a survivor. During the centuries before Calypsos discovery, it struggled hard to gain access to new market resources, driving the corporation dangerously close to the brink of ruin on several occasions. Their risk taking and persistence however, did pay off in the end. Omegaton Industries put the first humans on Calypso, a historical event which has been somewhat overshadowed by the ensuing robot wars, which forced the corporation to sign parts of the company over to the Federal Empire in order to escape financial collapse. This new influence did nonetheless secure their position as a leading interstellar corporation. Even though Omegaton were reluctant to relinquish control to a federal administration, it had little choice, and the corporation is now pledged to follow many imperial directives. Many of the leading individuals in control of Omegaton are trying to cut the cords of association with the Empire.

The corporation values loyalty and hard work above all else, a trait that has helped them survive the worst of times and which has also made them a trustworthy ally for the Federal Empire. Backed up by a strong federal economy, the struggle for survival is now based on keeping the new partners satisfied, a fact regarded as a waste of power to some of the more prominent owners of the company.

Quotes by Omegaton Industries about:

Chikara OmniWorld: "They are strong enough to allow themselves to be observant, and they are wise enough to keep silent about what they see."

Genesis Star: "They are kept away by the same shadow that keeps us under its protective shade, like little children afraid of the dark and of what dwells therein."

Omegaton Industries: "It may look dark living under the shadow of another, but at least it's safe"

Equipment

Weapons

Even if Calypso has a solid space defense network and an advanced system of shield generators to protect the urban colony itself, it is still a hard world to live in.

Robots were normally used to gradually expand the colony as the human population grew but since the robots aren't reliable anymore the future colonization of Calypso has to be done by the settlers themselves. In order to fight the invading robots and to sway off mutant raiders and other domestic threats, the citizens of Calypso have been given access to a large variety of different weapons and armor.

According to a plan created by the Federal Empire, it provides the colony with military aid, and has granted many weapon manufacturers permission to ship firearms and close combat weapons to the open market on Calypso. As a result the public arsenal will continue to grow steadily as new weapons are introduced to the colony by eager military developers.

Be advised that the use of weapons inside the urban areas is strictly forbidden. The city is regarded as a secure zone and as a safety-precaution all offensive combat equipment will be shut off upon entering the city. In short, weapons will simply not function within these restricted areas.

Customized Weapons

The situation on Calypso has allowed weapon developers and manufacturers to field-test new weapons and sell them to the human population as part of their agreement with the authorities. Since imperial military forces aren't allowed to land on Calypso due to interplanetary politics and strong regulations, the need for better personal firearms has arisen to help the settlers defend themselves and the colony. This market frenzy in personal weapon development has ultimately led to the introduction of a totally flexible weapon system with several exchangeable parts, allowing customers to design their very own weapons.

EWE Laser Handgun EP-90

This is a light, easy to use, standard laser handgun. It was originally developed by EWE, Earth Weapon Enterprises, and manufactured by the imperial arms factories for use by federal security organizations. The gun became outdated and was replaced by a new standard issue model years ago but has remained in production for the public market. As a result it is by far the most used and widely spread sidearm in space.

EWE StarBlaster Combat Rifle AR5

This is a compact laser assault weapon, developed and manufactured by EWE, Earth Weapon Enterprises. The weapon was originally meant for the imperial military forces but it was quickly made available to the settlers on Calypso to aid them against the robots during the first robot war. Since then it has been available at local weapon shops in all the main cities on Calypso and is still advertised as "the weapon that won the war".

Weapons Introduction

There are several different weapons available on Calypso, ranging from close combat melee weapons to powerful long-range firearms. Hi-tech melee weapons include energy-amplified blades and pole arms. Basic firearms include all categories from handguns and rifles up to launchers and heavy support weapons that fire either solid projectiles or energy beams.

The latest in arms development is the introduction of more flexible weapon systems with several interchangeable components. This allows people to customize weapons to fit their own needs by choosing specific components. These customized weapons are available with different adaptive capabilities and variable extension modifications. The available range of accessories depends on how flexible each weapon model is when it's purchased.

The situation on Calypso has allowed weapon developers and manufacturers to field-test new weapons and sell them to the human population as part of their agreement with the local and interstellar authorities. Since government military forces aren't allowed on Calypso, citizens require new and better weapons to defend themselves and their home world. This has ultimately led to constant development of new weapons and to an expanding market offering a growing arsenal of different personal weaponry.

"A standard issue big gun is nothing compared to a customized weapon of your own choice."
- Ly Zypher, Citizen of Calypso

Firearms

Firearms are the most common form of personal weapons available. They range from handguns, rifles to launchers and other larger weapon types. All modern firearms are energy weapons and fire various forms of energy to inflict damage but they are also capable to convert the energy into solid projectiles. Here is a list showing the range of the first categories of firearms available. Every category will contain a variety of different models, including the previously displayed EP-90 Laser Handgun and the AR5 Combat Rifle. New firearms categories and models are under constant development and will be added as they become available.

Handguns

This is a category of small firearms that can be held and fired with one hand. The fire rate is usually quite low due to lack of space for an efficient cooling system within such a small frame. Heavy handguns can be very powerful weapons but any weapon can be very efficient in the hands of a skilled user.

Rifles

This is a category of partially automatic firearms. Standard rifles have slower rates of fire than assault weapons but they generally have Riflebetter accuracy and range than other firearms. Heavy rifles are also initially more powerful and can deliver a greater concentrated blast of energy to inflict more damage

Assault Rifle

This category includes various automatic rifles that are designed for individual use in combat. Assault rifles in general are capable

of very rapid rates of fire and can inflict moderate to severe damage, depending on whether the target is hit by a scattered or a well-concentrated burst of fire.

Launchers

This category includes heavy destructive weapons that can deliver massive charges of pure energy or fire various forms of devastating missiles. Launchers are very energy-consuming weapons but are capable of inflicting far more damage with one single hit than most other categories of weapons.

Melee Weapons

Melee weapons are handheld close combat arms ranging from blades to pole arms. All standard melee weapons are energy-based and use a common form of technology called Phased Modulation. This allows melee weapons to strike through personal energy shields far more efficiently than any ordinary solid or energy-based projectile. Because of the somewhat crude design of this new technology, it can't be combined with ranged weapons, which gives the melee weapons a good advantage over firearms. New melee weapons are constantly being developed and will be added to the list as they become available.

Pole Arms

This is a category of hafted weapons of various lengths and design that can be either sharp or blunt. Pole arms include a large variety of different close combat weapons, such as axes, spears, glaives, staffs and scepters. Pole arms are divided into long and short pole arms that are used with either one hand or two hands depending on the size of the weapon.

Blades

This is a category of sharp cutting weapons where the blade is attached to a handle or hilt. There are many blades of various lengths and design. They have been divided into two subcategories, which consist of short blades such as knives and daggers and long blades such as sabers and swords. Blades are used with either one hand or two hands depending on the size of the weapon.

Armor

Not much info about armor at this moment, we only know that:

- There will be over 200 armors (face armor, body armor…).
- You will be able to wear your armor anyway you like it, just like you will be able to wear clothes the way you like it.
- There will be alot of difrent armors, the best will be the most expensive.
- You will have a natural armor, a light energy shield surounding you.

Armor Introduction

Armor is a defensive covering worn to protect the body against weapons. Personal body armor is primarily used as an extra protection in combat. Body armor comes in different forms and can be combined to cover all parts of the body. The main parts include the head, the torso, the arms and legs, but there are also armor parts for the face, hands and feet. Any armor you choose to wear will fit your body regardless of your size or shape. When an armor part or a set is activated, its atomic structure is automatically adjusted when it's rematerialized on the human body. Standard body armor will not require energy to function, but advanced power armor with enhanced capabilities will consume energy when activated.

Energy Shields Introduction

Personal energy shields are an energy-based form of armor that have become the most basic form of protection in the future. Their slim lightweight designs makes modern portable shield generators very practical compared with standard body armor. An active shield generator will surround its owner with an invisible force field, which in turn protects the wearer from harm. A harmful force will be repelled at full power while slow and harmless actions are allowed to pass through the shields, allowing people to perform normal tasks without hindrance. As with most advanced technological devices, personal shield generators will require energy to function.

Clothes and fashion

Clothes are an important part of the player character's visual appearance. How you choose to dress your player character will help to develop your appearance. Clothes also serve as an expression of your own individual style and personality. Even armor can be worn in combination with clothes, although there's no need to be dressed for combat action when you could be dressed for social interaction instead. In the end it's all about personal style and taste, and every person has the freedom to choose what they want their player character to wear. That's why there will be a wide assortment of clothing to choose from in the world of Project Entropia.

Clothing shops inside the vast urban communities will offer an expanding variety of different clothes to put on player characters. These outfits will vary from a wide range of standard clothing to the introduction of limited collections of fashion wear. Clothes include anything from skirts, pants, and shirts, to jackets, evening dresses, footwear and much more. Single clothing items as well as complete sets will be available. This large variety will allow you to create your own combinations, resulting in a personal wardrobe for your player character. The phrase "one size fits all" is a future standard; so all clothes you acquire will automatically fit any human body.

"They say that tough people wear armor and cool people wear clothes, but personally I like to dress up in both."
- Ulyssia Starborne, Citizen of Calypso

The man in this happy couple *(left image)* Couplewears a tight sweater from Luna Line, specially designed to remind us that we still live in space, even if we are on a planet. His pants are from Renegade Fashion products that are known for their unusual designs. If you like attention this is the stuff to wear, if you dare. The woman on the other hand wears a more cautious and sturdy looking outfit from the Work Wear collection, made for anyone who wants to dress right as a professional when they have a job to do.

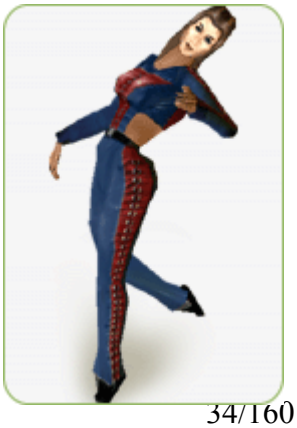

This pair *(right image)* has teamed up and is standing back-to-back, ready to fight for their freedom in these full body outfits from Luna Line. The design is a part of the Exodus Collection and has been inspired by the ship space suits that were used by the first human pioneers on their way to Calypso.

Female clothes

"Why look good when you can look great" is a slogan you will appreciate when you wear this wonderfully combined set of clothes from Star Satin *(left image)*. The revealing top with front straps and the sturdy exofabric design on the pants keeps your style in tune with any modern fashion on Calypso.

The Silk Line is a range of clothing products that are made to be as comfortable as they look. Anyone who sees you dressed up in these outfits *(right image)* will know

that you feel good about your choice of clothing. The open back of the top and the matching pants adds a sportier look to this nice set of clothes.

Male Clothes

These outstanding clothes are from a collection designed by Spiral Street. These products set the standard on the new line of modern urban streetwear, and their personal motto and market slogan “the right clothes attract the right people” simply state that their clothes are the right clothes to wear.

Items

Foodpacks

A Food Pack is a package that contains varied forms of compressed protein. This type of compression gives it a higher energy value and less weight than the original food product. A Food Pack is also more durable and won't deteriorate at the same rate as raw or cooked food when it's stashed and carried. There are several kinds of Food Packs containing different types of products, such as meat, fish, dairies, corn and greens. The different types of Food Pack content are easily identified by a distinguishing color code on each package. The Food Pack can be consumed without any preparation, or used in a Food Converter to create more nutritious meals.

Energy Cells

These items are used to power various devices such as weapons, tools and personal energy shields. Each category of devices requires its own type of energy cell. Energy cells can contain different amounts of energy depending on their capacity. Every energy cell is added to a total energy source when carried or stored. All energy-powered equipment that is activated will automatically draw energy from this source, provided it belongs to the right category of devices.

Materials

These include metal ores, textiles and any other types of material that may be found and extracted from the environment. Material is used to create devices and items such as tools or clothes.

Chemicals

A variety of chemical substances, used in conjunction with a chemistry set to create different chemical injection fluids called drugs

Mindforce History

Scientists have been exploring the mental and physical depths of the human mind for ages and soon discovered ways to stimulate the still inactive parts of the brain. Further experiments finally revealed hidden lairs of powerful latent mental abilities within the human mind. Rare paranormal abilities such as Extra Sensory Perception, telekinesis and telepathy had only been the beginning. By adding external energy to boost these powers new ones emerged with a force unlike anything ever experienced by any human. This new mental power was given the name Mindforce - the force of the mind.

The discovery soon became official to the public with the vision that every human would be able to activate and make use of his or her latent mental powers. It wasn't until later when the new mind enhancement technology became available to the open market that practical devices could be constructed. These devices could enhance and fuel the Mindforce with the energy it needed to truly manifest itself by the use of will and skill. More powerful prototypes were tested in various hostile conditions on Calypso with good results, which gave the citizens legal access to higher degrees of Mindforce enhancements.

Mindforce is now said to be the ultimate tool of the future and is considered by many as the next step in human evolution.

Mindforce & Aspects

Mindforces are latent mental abilities hidden within the mind of every human being. To be able to invoke and control these dormant powers a small cybernetic Mindforce implant is integrated with the brain to create a rapid artificial evolution of the mind. Today this device is considered basic standard equipment on Calypso, making the use of Mindforce easy and available to all human settlers.

The amazing powers of the Mindforce are grouped in several different Aspects. These Aspects already exist inside the human mind but in order to invoke them it requires knowledge, training and experience. All these Aspects are also divided into different Levels, depending on the force and control requirements of each Aspect. Access to these Aspect Levels will in turn require a certain degree of knowledge and also an upgrade of the Mindforce implant, all in order for the individual to safely control these increasingly more powerful Aspects.

The use of Aspects will consume energy from the Mindforce implant and cause mental stress and fatigue on the human psyche. Consequently the use of more powerful Aspects will consume more energy and cause a higher mental fatigue.

Science proclaims that the number of Aspects is only limited to your own imagination. The robot threat on Calypso presents an extreme situation and ideal grounds for rapid Mindforce development, just as any other tool or weapon needs to be properly field tested to reveal its full potential. As humans continue to develop the use of Mindforce on Calypso, new latent Aspects of the mind will surely be discovered. It's only a matter of time and devotion...

"To create something with your hands is a great achievement, but to create something with your very thoughts, that is a divine experience."
- Iziru Takamoto, Mindforce Master

Mutants

The mutants belong to a genetically degenerated breed of neo-native humanoids. Several generations of mutants have passed rapidly on Calypso, resulting in a continued variety of different mutations amongst their kind. Their appearance can vary from strange and ugly to sickening or horrifying. Some are so extremely mutated physically, that they no longer look like humanoids, while others have suffered mental mutations, allowing them to employ mental powers similar to the human Mindforce. Permanent genetic alterations have also created several distinctive breeds of mutants.

The mutants are descendants of the first settlers on Calypso, but are no longer classified as human beings. They are outcasts, a tragic reminder of the past and of the robot revolt. Exiled from human society, they weren't expected to survive for long - but they did. The mutants now roam the wild outskirts and ruins of vanquished old cities in growing numbers. Despite their mutations, or perhaps because of them, the mutants have managed to survive on their own and thrive to such a level that they could now pose a threat to the future human colonization of the entire planet.

Despite their human degeneration, many mutants are very intelligent, and they still possess enough knowledge to remain well aware of the main events in their past. Mutants are as multifaceted as any human, and some can be both friendly and trustworthy enough to trade with, while other mutants hate humans enough to try and kill them on sight. Despite these different alignments all mutants see the robots as their common hated enemy, and this legacy might turn a mutant into a human ally in the fight against the robots.

"It's sad that our closest relatives on this world are our most distant cousins"
- Anonymous

The Mutants were once humans, they were among the first pioneers that went to Calypso. After the robots used Nuclear devices in the Robot-Revolt they didn't die but were geneticly alterd. We assumed they died after a while but somehow they managed to survive, now they form one of the biggest threaths to humans on Calypso.

Humans and Mutants have two things incommend: they can both use guns and they both hate the robots. Them hating the robots will maybe one day mean they will fight by our side in the final battle. But be adviced, not all Mutants are unfriendly.

Plants & Vegetation

Most native plants on Calypso are very similar to those on earth because they use photosynthesis, which means that carbohydrates are synthesized from carbon dioxide and water using light as the energy source. This process usually releases oxygen as a byproduct and in this case it helped make Calypso a very well suited world for humans, who need an oxygen atmosphere to breath. However, before the Odysseus Probe landed, the first robots on the surface reported that the climate and atmosphere was slightly different from what it is today, with a lot more plant and animal species. Not all of these life forms survived the slow terraformation of the planet, when the robot machines begun to change the climate and atmosphere to create a new, stable, and more suitable environment for the first human arrivals.

Despite this alteration, life recovered very quickly on Calypso, nursing a new breed of plant and animal species, well adapted to the new environment. Indeed, some plants were probably not effected at all by this change. There are still many plants on Calypso, some of which can be very strange and even dangerous, that rely on other food sources to sustain themselves. Even so most of the plants are harmless and can be both as strange as they can be beautiful. When the first settlers did arrive, they were awestruck when the saw this world and named the first sector of the colony 'New Eden'.

These first human settlers also brought with them various plants from Earth, which were used to create gardens called 'Eden's of Earth' within the urban communities - the colony citadels. The gardens were meant as resorts and agricultural greenhouses to make the settlers feel more at ease and to help them adapt gradually to their new home and environment on an alien world. However, after the robot war these plants quickly spread outside these previously confined gardens. As a result most plants and trees inside the colonies and around the urban zones consists of a genetically designed flora based on old earth species, species that are more commonly referred to as hybrids. Genetically well adapted to the new environment, these hybrid plants have flourished and pushed aside the natural flora where they grow. However, the inserted plant life has never spread too far out from the human areas and is currently being held at bay by the native plant life, which continues to remain the dominant form of life on the planet.

Native Vegetation

Velumbra

This desert tree has several large sail-shaped leaves. These leaves are extended in the evening and retracted in the morning. During the night the sail-shaped leaves pick up condensed drops of water, which then roll down the branches, to the trunk where they're collected. These sails are retracted during the day when the branches holding them are pulled back into parallel position with the trunk.

Arx

At first glance this tree looks like several separate trees but is not. The core tree has a very complex root system, which surfaces around the core in a circular formation, creating several high and dense shield-shaped trunks as a means of protection. The core itself is also covered in these shield-shaped

trunks and it has most likely developed this to protect its softer and more vulnerable interior from giant herbivores; this is why it's sometimes referred to as the Shield Tree. The Arx can be found in most forests and is used by many smaller animals as a hiding place from predators. In turn these animals provide the tree with plenty of natural fertilization

Numaki

This tree looks like a fallen tree-trunk standing on several legs that are actually its roots. The tree filters water both ways through its massive trunk, which is kept raised above the ground and preferably across large bodies of water. This tree, which is also known as the bog-tree, can be found in swamps, marshlands and other moist areas that are held in dense mist. Its strange shape allows it to be used as a natural bridge to cross muddy rivers and other treacherous terrain.

Cresco Crystals

These are not organic plants but are known as trees because of their growth cycle. They are in fact defined as crude mineral life forms. The "roots" of the crystal are made up of rare mineral compounds that react with water and certain other substances causing them to expand up through the surface. After further contact with oxygen and sunlight, long pointed crystal shapes are formed. As the "roots" stop expanding, the crystal tree - which can no longer be sustained - disintegrates, losing its color and transparency. Its remains filter down through the earth with water and seem to provide the basic mineral nutrients that allow new "roots" to grow. This is why they're more commonly called Crystal Trees - because of their noticeable lifecycle. The crystals themselves are very common. Their unstable compositions however cause rapid deterioration when removed, making them worthless as excavation minerals

Venor Traba

This flesh-eating plant also resembles a fallen tree trunk. Its name means Hunting Trunk but its strange shape has given it the more common nickname "Killer Cucumber". As a plant it's immobile and has to wait patiently for prey to pass its mouth. It captures its prey with a long tentacle tongue and then pulls it into its mouth. The spiky mouth then shuts and the prey is devoured. It has long, spiky and poisonous thorns over its thick armor, which function as powerful deterrents to any larger beasts that could eat or crush it. The plant responds to the scent of an animal in defining its prey so humans and other larger creatures are generally not attacked.

Astralis Arboreus

*(left image)*This is a large tree with a top consisting of four very large and bright green leafs. The base of the trunk is very wide and richly colorful on the older trees. The strange shape, color and pure splendor have deemed it one of the most beautiful trees on Calypso causing it to be more commonly referred to as the Star Tree.

Migrufolium

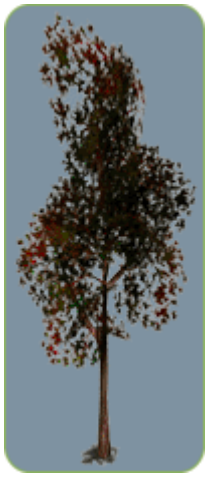

(right image) This tree has a small circular top of leaves that span out from its top branches, almost like membranes. When the tree has grown big enough the lower part of the trunk becomes swollen. During this period it

also develops more and longer thorns in an attempt to protect itself from large herbivores.

Fungusilva

This tree looks like a giant mushroom and most people simply like to refer to it as the Mushroom Tree. These large trees grow in humid conditions, preferably near swamps and other types of flooded vegetation. It has developed a poison to prevent herbivores from feeding on its soft interior but some native animals have developed immunity to it and are using it to make themselves poisonous, thereby protecting themselves against predators.

Native Vegetation

Masple

(left image) This tree is based on species from Earth called the maple and aspen. The tree is of an average size and has a smooth trunk. Its top is uneven and somewhat scattered and it has reddish leafs with pointy edges. It's likely to have a lifespan of about 200 Earth years.

Firlock

(right image) This tree is based on a species of trees from Earth called fir trees, two old breeds called the spruce and the hemlock. These trees have long rows of needles instead of leafs and the needles are attached directly to the branches. Its top is narrow and cone-shaped with all its branches hanging down from the straight trunk. There are two known types of hybrid fir trees on Calypso, one blue, which has jagged branches and one green with a more smooth appearance. Both types of fir trees are believed to have a life span of nearly 400 Earth years.

Belm

This tree is based on a species from Earth called the elm and the beech. It's quite a large tree with a smooth trunk and thick upright branches giving it a seemingly flat top. Its lifespan is estimated to reach up to 500 Earth years.

Robots

The invading robots represent the main threat to the humans on Calypso. These robots come from two planets called Akbal and Cimi, located in another nearby star system. These desolate robot outposts were originally large automated mines and refineries before they rapidly evolved into robot war factories.

It remains unknown why these distant robot outposts suddenly saw the human race as their enemy, but evidently they suffered the same infection that caused the Robot Revolt on Calypso. The robots from Akbal-Cimi have somehow gained access to a superior technology that allows them to achieve interstellar travel through teleportation. This knowledge is used to transport robot invaders across space, and land them almost directly on the planet surface of Calypso.

These menacing machines will never stop in their fanatical quest to defeat the humans and conquer the planet. Citizens who choose to fight the robot invaders must be prepared for a long and hard struggle, because this is only the beginning…

"It was foreseen by our ancestors a long time ago, that robots would one day turn against their creators, but it is still not yet decided who will stand victorious."
- Ximon Galax, Planetary Commander of Calypso

Attackers

The attackers are the main land-based robot assault units. They are distinguished war-machinesSweaper without humanoid appearance and are equipped with a death-bringing arsenal of weapons. Their mobility varies, but they are usually designed to be very swift and mobile. This allows them to cover long distances and strike against any given target. They are comparable to tanks, which make them one of the most dangerous robots to encounter on the field

Bunkers

These are stationary robots that function like heavily armored sentry guns with a rotating turret. They are usually built by a Constructor and used for perimeter defense near a base. Their weapon systems may vary, ranging from energy weapons to solid missiles. In general, the bunkers are effectively protected by shields or armor, which can make them difficult targets to destroy despite their immobility.

Constructors

The Constructors are important components of the robot invasion force. In order for a Robot Matrix to upgrade and expand its robot base, these robots are necessary for creating new structures, extracting resources and establishing new facilities like mines. They are not designed for combat but are capable of using their diverse tools to defend themselves when necessary.

Workers

These are a class of very simply designed humanoid robots. Similar models were originally used during the colonization of Calypso as human replicas to help maintain the colony citadels before the first human arrivals. These robots went on a rampage during the Robot Revolt and after the war; many of these old Workers are still believed to lie inactive and hidden inside ruins and secret stockpiles. The invading robots now produce a new generation of Workers, some specializing in maintenance duties while other variants are equipped for combat.

Destructors

These robots are usually constructed as disposable units and are not designed to be retrievable. They are designed as smart traps or automatic seek-and-destroy devices. They are dropped or planted in an environment where they can wait for the right target to come within range. When the units are triggered they are usually destroyed themselves in the attack. If a self-destruct mechanism doesn't destroy the Destructor the enemy most likely will after a failed attempt has revealed it.

Transporters

These robots transport various forms of cargo, usually materials and resources, to the base, or carry and plant various robot devices. They are equipped with large Atomic Compression Modules and short-range teleportation systems to dematerialize or rematerialize the cargo they carry. Transporters are also used for recovering wreckage or scavenging items for recycling. Transporters are not designed for combat, making them quite vulnerable to attack. Therefore, other types of robots are often assigned to a Transporter as escorts, giving it protection on away missions.

Scouts

These are small, fast and agile units equipped with advanced sensor systems. They are used as scouts and move ahead of other units to scan the nearby area for possible threats, enemy targets or new resources. They can also be used to guard the flanks of larger groups of robots. Scouts are often poorly armed and badly protected but their small design, speed and maneuverability makes them hard targets to hit. They are still considered dangerous however because of their assigned surveillance capabilities. Upon detecting a threat a scout will alert the base or nearby combat units to neutralize the danger.

Defenders

These robots are designed as sentinels. Their main tasks are to guard and defend their robot base and to escort and protect more vulnerable robot units, such as the Constructor. Defender models range from small, fast and agile units that can quickly intercept an approaching threat to large and slow models that are powerful enough to neutralize a threat before it can cause any damage.

Skyfighters

These robots are constantly airborne and are capable of flight at high speed and altitude. SteelbirdThey range from high altitude interceptors to low altitude gun ships. The high-flying Skyfighters can operate at altitudes close to the edge of space if necessary and only attack flying targets, such as skyships, shuttles and similar vessels. Low-flying Skyfighters, however, are specialized in striking at ground targets such as humans, although these robots will attack flying enemy vessels as well if such targets come into range.

Warriors

These robots are dreadful war machines and are by all right considered extremely dangerous. They are specially designed to spread terror and destruction wherever they go, killing anything human that may stand in their way. Warriors can operate very well alone but are also known to work in pairs. In a group of robots they most often function as main combat units, always standing on the front line of the assault.

Troopers

These are pure combat robots, although still humanoid in appearance. They have a heavy reinforced body and are equipped with built-in energy weapon systems, which prevent the weapons from being scavenged and used against their own forces. Troopers have very good armor and powerful shields, making them into very tough opponents. The weaponry varies between different models, from single standard energy firearms and energy blades to dual firearms and heavy energy weapons.

Settlements

The colony on the planet Calypso consists of an increasing number of settlements that vary in both size and population. They range from dazzling metropolises and prospering industrial cities to more or less fortified outposts in the wilderness. For the time being the government and corporations control all these settlements, but as the population increases, human civilization on Calypso will also expand. In time new settlements will be founded and growing communities will be established all over the world by brave pioneers, and you can be one of them.

Capitals

The main cities on Calypso are called capitals and consist of very large and newly constructed primary settlements, each one financed and founded by one of the largest main corporations on the planet. These capitals are seen as growing cultural centers and expanding urban communities for the new human civilization on Calypso, a place where peace and prosperity can flourish inside a secure environment. Capitals are very well protected by impenetrable force fields, which only registered citizens are able to pass through. Each capital is a proud symbol to the splendor of human achievement, introducing new forms of entertainment and distributing all the latest merchandize that culture and technology has to offer.

Cities

These settlements are old human strongholds that were established during the war with the robots. They were once military bases that later grew into cities after the war, and they are now the home of the planet's veteran inhabitants as well as new settlers who choose to seek their fortune here. Like the large capitals these cities are safe havens for all humans who choose to live in these urban environments. Each city is protected by advanced defense systems and contain important industrial facilities that refine resources and provide the colony with merchandize for the domestic market. These cities are therefore able to offer a much larger variety of equipment to its citizens and visitors then any of the minor settlements.

Outposts

Outposts are small settlements that are tactically positioned in the deep wilderness, far away from any of the larger settlements. The size of these outposts can vary from small trading stations to forts surrounded by walls and defense systems. They function as human strongholds and temporary shelters for travelers and can provide visitors with various services, such as new supplies and equipment.

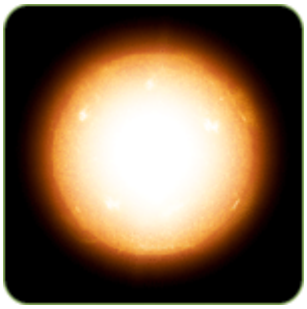

The planetary star system

All the planets in this star system have been named after old gods and goddesses from an ancient Earth culture and mythology. This is because the planet Calypso was originally named from the same ancient source of cultural information that was used to name the Odysseus Probes, a mythical adventure and epic journey of a hero named Ulysses.

Omega 16 Reticulum

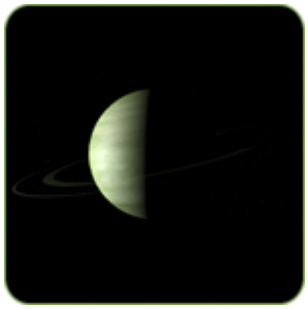

This star is a large yellow sun with a surface temperature of 6000°C.

Type: G4 type Star
Mass (Earth=1): 616130
Mass (metric tonnes): 3,69*10e27
Diameter (km): 1392000
Radius (m): 6,96*10e8
Volume (Earth=1): 1,3*10e6
Volume (m3): 1,41*10e27
Density (Water=1): 1,47
Axis Angle: -
Gravitational force (m/s2): 508
Escape Velocity (km/s): 841
Surface Temp (°C): 6000
Orbital period: -
Rotational period: 31 days
Distance from Sun (AU): -
Distance from Sun (M km): -
Number of moons: 0

Ixion

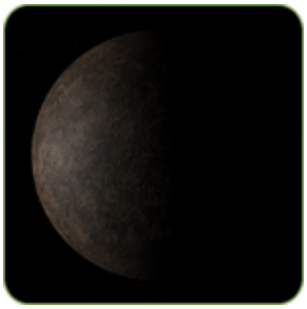

This is a medium gas giant with a surface temperature of 1100°C. The planet has one moon orbiting it.

Type: Medium Gas Giant
Mass (Earth=1): 117,2
Mass (metric tonnes): 7*10e23
Diameter (km): 131200
Radius (m): 65 600 000
Volume (Earth=1): 1086
Volume (m3): 1,18*10e24
Density (Water=1): 0,59
Axis Angle: -2
Gravitational force (m/s2): 10,85
Escape Velocity (km/s): 37,73
Surface Temp (°C): 1100
Orbital period: 63 days
Rotational period: 4 days
Distance from Sun (AU): 0,31
Distance from Sun (M km): 46,4
Number of moons: 1

Gorgon

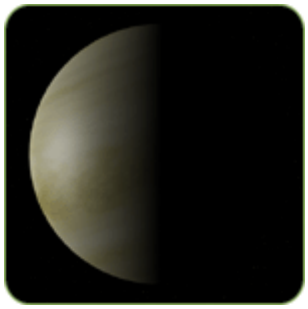

This is a rocky planet with a very thin atmosphere and a surface temperature of 400°C.

Type: Rocky Planet, very thin atmosphere
Mass (Earth=1): 0,092
Mass (metric tonnes): 5,5*10e20
Diameter (km): 7128
Radius (m): 3 564 000
Volume (Earth=1): 0,17
Volume (m3): 1,9*10e20
Density (Water=1): 2,89
Axis Angle: 18
Gravitational force (m/s2): 2,9
Escape Velocity (km/s): 4,54
Surface Temp (°C): +400
Orbital period: 191 days
Rotational period: 23 days
Distance from Sun (AU): 0,65
Distance from Sun (M km): 97,2
Number of moons: 0

Telesto

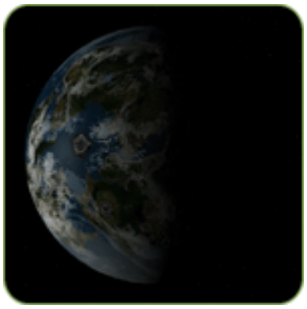

This is a rocky planet with a corrosive atmosphere and a surface temperature of 350°C. The planet has one moon orbiting it.

Type: Rocky Planet, corrosive atmosphere
Mass (Earth=1): 0,76
Mass (metric tonnes): 4,6*10e21
Diameter (km): 10964
Radius (m): 5 482 000
Volume (Earth=1): 0,63
Volume (m3): 6,9*10e20
Density (Water=1): 6,67
Axis Angle: -21,8
Gravitational force (m/s2): 10,2
Escape Velocity (km/s): 10,58
Surface Temp (°C): +350
Orbital period: 281 days
Rotational period: 19h
Distance from Sun (AU): 0,84
Distance from Sun (M km): 125,7
Number of moons: 1

Calypso

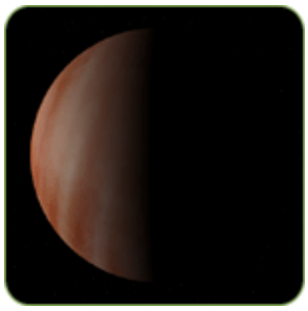

This is a living planet with an oxygen atmosphere and an average surface temperature of 25°C. The planet has two moons in orbit.

Type: Planet with oxygen atmosphere
Mass (Earth=1): 0,48
Mass (metric tonnes): 2,87*10e21
Diameter (km): 8836
Radius (m): 4 418 000
Volume (Earth=1): 0,33
Volume (m3): 3,61*10e20
Density (Water=1): 7,95
Axis Angle: 1,2
Gravitational force (m/s2): 9,81
Escape Velocity (km/s): 9,31
Surface Temp (°C): 25
Orbital period: 1 year & 91 days
Rotational period: 4h
Distance from Sun (AU): 1,16
Distance from Sun (M km): 173,5
Number of moons: 2

Janus 1

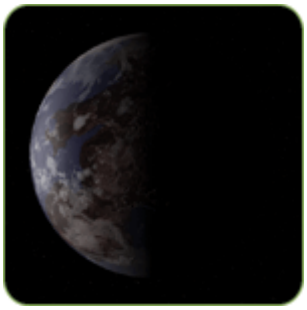

This is a binary planet system, having two planets circling around each other, Janus 1 and Janus 2. Janus 1 is a large planet with a methane atmosphere. Janus 1 have a surface temperature of between +50 to -50°C. The planets have three moons in orbit around them.

Type: Large Planet with methane atmosphere
Mass (Earth=1): 2,35
Mass (metric tonnes): 1,4*10e22
Diameter (km): 16720
Radius (m): 8 360 000
Volume (Earth=1): 2,25
Volume (m3): as2,45*10e21
Density (Water=1): 5,71
Axis Angle: -77,5
Gravitational force (m/s2): 13,37
Escape Velocity (km/s): 14,95
Surface Temp (°C): +50 to -50
Orbital period: 2 years 295 days
Rotational period: 13 days
Distance from Sun (AU): ~1,99
Distance from Sun (M km): 252,8
Number of moons: 3

Janus 2

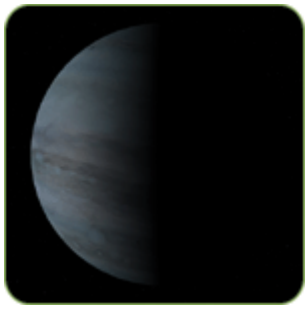

Janus 2 is a planet half the size of its larger companion, Janus 1, and has an oxygen atmosphere, making this planet suited for the further stellar expansion of the colony.

Type: Planet with oxygen atmosphere
Mass (Earth=1): 1,14
Mass (metric tonnes): 6,8*10e21
Diameter (km): 12911
Radius (m): 6 455 500
Volume (Earth=1): 1,04
Volume (m3): 1,13*10e21
Density (Water=1): 6,02
Axis Angle: -27
Gravitational force (m/s2): 10,89
Escape Velocity (km/s): 11,86
Surface Temp (°C): -15 to -50
Orbital period: 2 years 295 days
Rotational period: 12h
Distance from Sun (AU): ~1,99
Distance from Sun (M km): 252,8
Number of moons: 3

Hypnos

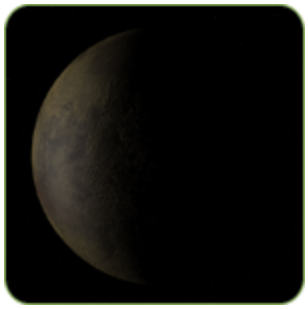

This is a large gas giant, 18 times the size of Calypso, with a surface temperature of -130°C. The planet has eight moons in orbit.

Type: Large Gas Giant
Mass (Earth=1): 439,4
Mass (metric tonnes): 2,6*10e24
Diameter (km): 161950
Radius (m): 80 975 000
Volume (Earth=1): 2043
Volume (m3): 2,22*10e24
Density (Water=1): 1,17
Axis Angle: 12,6
Gravitational force (m/s2): 26,45
Escape Velocity (km/s): 65,46
Surface Temp (°C): -130
Orbital period: 16 years 83 days
Rotational period: 8h
Distance from Sun (AU): 6,41
Distance from Sun (M km): 959
Number of moons: 8

Prometheus

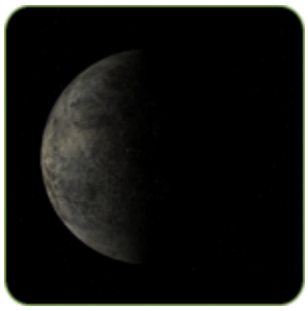

This is a rocky planet with a thin atmosphere and a surface temperature of -155°C.

Type: Rocky planet, thin atmosphere
Mass (Earth=1): 3,01
Mass (metric tonnes): 1,8*10e22
Diameter (km): 19971
Radius (m): 9 985 500
Volume (Earth=1): 3,84
Volume (m3): 4,17*10e21
Density (Water=1): 4,32
Axis Angle: 26
Gravitational force (m/s2): 12,04
Escape Velocity (km/s): 15,5
Surface Temp (°C): -155
Orbital period: 23 years 333 days
Rotational period: 312 days
Distance from Sun (AU): 8,3
Distance from Sun (M km): 1242
Number of moons: 0

Artemis

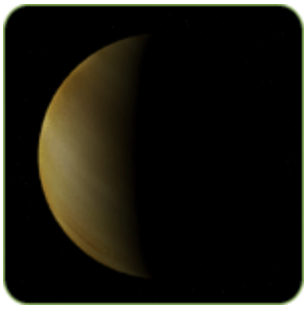

This is a rocky planet with a thin atmosphere and a surface temperature of -175°C.

Type: Rocky planet, thin atmosphere
Mass (Earth=1): 0,84
Mass (metric tonnes): 5*10e21
Diameter (km): 14006
Radius (m): 7 003 000
Volume (Earth=1): 1,33
Volume (m3): 1,44*10e21
Density (Water=1): 3,49
Axis Angle: -18,6
Gravitational force (m/s2): 6,8
Escape Velocity (km/s): 9,76
Surface Temp (°C): -175
Orbital period: 43 years 243 days
Rotational period: 4 days
Distance from Sun (AU): 12,4
Distance from Sun (M km): 1855
Number of moons: 0

Maia

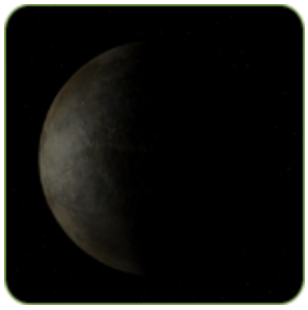

This is a small gas giant with a surface temperature of -205°C. The planet has three moons in orbit around it.

Type: Small Gas Giant
Mass (Earth=1): 10,6
Mass (metric tonnes): 6,35*10e22
Diameter (km): 39748
Radius (m): 19 874 000
Volume (Earth=1): 30,3
Volume (m3): 3,29*10e22
Density (Water=1): 1,93
Axis Angle: 40,1
Gravitational force (m/s2): 10,73
Escape Velocity (km/s): 20,65
Surface Temp (°C): -205
Orbital period: 95 years 200 days
Rotational period: 16h
Distance from Sun (AU): 20,9
Distance from Sun (M km): 3127
Number of moons: 3

Reah

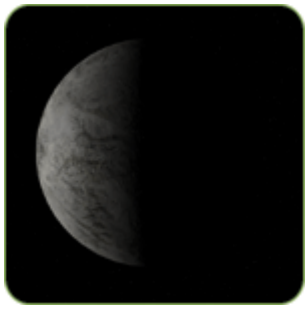

This is an icy planet with very thin atmosphere and a surface temperature of -220°C.

Type: Icy Planet, very thin atmosphere
Mass (Earth=1): 0,095
Mass (metric tonnes): 5,68*10e20
Diameter (km): 7230
Radius (m): 615 000
Volume (Earth=1): 0,18
Volume (m3): 1,98*10e20
Density (Water=1): 2,87
Axis Angle: 7
Gravitational force (m/s2): 2,9
Escape Velocity (km/s): 4,58
Surface Temp (°C): -220
Orbital period: 195 years 231 days
Rotational period: 22h
Distance from Sun (AU): 33,7
Distance from Sun (M km): 5041
Number of moons: 0

Thanatos

This is a small icy planet, roughly half the size of Calypso, with no atmosphere and a surface temperature of -230°C.

Type: Icy Planet, no atmosphere
Mass (Earth=1): 0,024
Mass (metric tonnes): 1,44*10e20
Diameter (km): 4960
Radius (m): 2 480 000
Volume (Earth=1): 0,06
Volume (m3): 6,39*10e19
Density (Water=1): 2,25
Axis Angle: -30
Gravitational force (m/s2): 1,56
Escape Velocity (km/s): 2,78
Surface Temp (°C): -230
Orbital period: 332 years 202 days
Rotational period: 6 days
Distance from Sun (AU): 48
Distance from Sun (M km): 7181
Number of moons: 0

Technology

General

Quantum Technology

Most hi-tech equipment of the future is based on the use of Quantum Technology, which is considered the key to the universe. This scientific technology has revolutionized the existence of the Human species several times during the past century, providing the human civilization with advanced AI quantum computers, atomic compression, hyperlink communication, teleportation, Jump Rails and Space Gates for interstellar travel.

Atomic Compression

Interstellar travel is limited to small vessels that are transported through vast energy consuming Space Gates. It was therefore necessary to find a way to pack the cargo load more efficiently, allowing as much goods as possible to pass through the gates. By converting an object into electron fluidium it could be contained and stored inside a small electromagnetic field. This process uses short-range particle teleportation were the atomic structure of the target object is dissolved and transferred, or "atomized and compressed" as it's more commonly called. By scanning and saving the original pattern of the objects atomic structure when it's transferred it could be re-atomized again and returned to normal shape and structure. The technology was first used on industrial raw material with simple atomic structures but successful experiments soon allowed more complex multiple atomic structures to be dissolved and restored.

Personal Atomic Compression (PAC)

The atomic compression technology is now available on the public market and used for easy transportation and storage of personal items by using a portable device called a Personal Atomic Compression unit or PAC. The desired item can be teleported at close range into the PAC were its atomic pattern is stored in a data buffer while a computer keeps track of the items inside the inventory. The atomic compressor will collapse the atomic structure of the item into freely floating particles, thus reducing its size while the weight itself remains unaltered. A PAC is considered today as basic standard equipment throughout the population.

Neuron Enhanced Computer Implant (NECI)

This is a cybernetic neuron-controlled nano-computer that is implanted into the skull bone and directly linked to the brain. The NECI functions as a personal computer, communication unit and ID. The NECI allows an individual to log on to modern technological equipment that is equipped with a computer transmitter. The NECI will display status and information on any desired object, such as the personal ACP inventory, weapons or public teleportation systems. The NECI is absolutely vital for memory retrieval and human resurrection.

The NECI also includes the popular CHAT-chip, which stands for Cybernetic Hyperlink Augmentation Transmitter. The CHAT allows people to communicate with each other, even across long distances.

Resurrection

Science has harnessed the creation of life itself by obtaining every genetic code to all known forms of DNA. Combined with new advanced technology it gave Mankind the tools they needed to extend their own lifecycle. Even so, death was still very much present and it compelled human science to invent artificial immortality. By using a micro biochip implant linked to the human brain it can read brainwaves and store memories, including visual images, thoughts, emotions and individual personalities. The data can then be gradually downloaded during life and stored in a databank, allowing the entire mind pattern of a single human individual to be saved for the future and later transferred to a new human body. The new body is an exact copy of the original body in the form of an artificially grown and mindless clone of the original body. By combining a biochip with a microchip computer implant and a hyperlink it allows the whole life of an individual to be constantly connected and downloaded into a databank. Human resurrection or the prolonging of human life is held under strict laws and within specific jurisdictions. Neither one has been available to the general public elsewhere but the desperate situation on Calypso during the first war against the revolting robots gave the colony a special status. As a result the Federal Empire passed a legal motion to make human resurrection available to all settlers on Calypso. The resurrection itself takes place up in orbit, inside the space vessel Exodus where the memory-patterns of all citizens are received and stored inside a large databank. The resurrected individual is then teleported down to a Hospital or a Resurrection Ship on the surface, were the individual can continue his or her broken lifecycle. The reason for this arrangement is to assure a complete authorized control over the resurrection procedures but also because all Resurrection Ships in service are directly linked to the Exodus.

Teleportation Technology

Teleportation is the most common form of public transportation in the future. This is a vast area including all forms of teleportation, such as Teleporters and Televators. Teleporters are public teleportation units and the main form of transportation inside an urban area. Televators are local teleportation units, equivalent to doorways and elevators inside various buildings and institutions. Teleportation is also used to purchase and distribute merchandise as well as to collect and store items.

During the robot wars the settlers constructed armored teleport stations all over the planet to allow human troopers to arrive quickly and safely to any active combat zone and fight back robot hostiles. These teleportation bunkers allowed the humans to strike down hard and swift where it was most needed and use their forces more efficiently against the robots, which outnumbered the humans at that time, both in numbers and resources. Many of these old postwar teleport systems are still functional and can be used freely by any settler who locates them.

Space Communication Technology

The Interstellar Transportation Network

All Space Gates form a network for interstellar travel. Connection points for transits and rerouting vessels contain several Space Gates and are called Gate Stations or Central Gate Stations depending on the number of gates that make up the installation. A single Space Gate located at the end of the network is called an Omega Space Gate and these gates are the final points of destination on the

expanding Space Frontier. For economical reasons many Space Gates are maintained by local authorities and are only opened at specific times or in emergency situations. Still, the Space Gate is the most vital element to all forms of interstellar travel within the Federal Empire. The most crucial routes and connection points are therefore well guarded and controlled by the Federal Imperial Forces.

Jump Rails

These are very long and complex space constructions, powered by several matter/antimatter reactors and conductors. The diameter and length of the construction varies depending on the size of the vessel that is to be launched. Jump Rails function as subspace accelerators, launching a specially equipped vessel into a state of warp that will send it across an enormous distance in space. The vessels travel through several curled layers of time and space until it loses "jump velocity" and reenters normal space again. These curled layers are called warp waves. In order for a vessel to survive the force of a launch and the reentering into normal space it has to generate a warp shield. The force of the launch itself will usually destroy the Jump Rail, which makes it an expensive form of space travel. Jump Rails are not an exact science, which makes them an unreliable form of travel. Time is shifted when the vessel is passing through one warp wave and into another during its journey. The journey appears very short for the travelers as time is being compromised when it may take years to accomplish for an outside observer. Jump Rails remain the only way to transfer large vessels cross the enormous distances of space but their cost make it far more economically attractive to build larger sector-based space vessels on site once a Space Gate has been successfully established.

Space Gate Technology

Space Gates are artificially made rifts in the fabric of space and time. When two linked gates are activated they will twist and turn the space between them and open a vortex into a warp tunnel, an otherwise rare space phenomena more commonly known as a "worm hole". Travel between the two gates is instant and can take humans light-years across space from one point to another in the blink of an eye. Even though the Space Gates are large and complex constructions the openings they generate are very tight passages. In order for a vessel to slip through safely it has to be fairly small and slim. Interstellar flights are therefore made by smaller spacecraft, roughly the size of shuttles or long rows of connected transportation vessels. A Space Gate also consumes vast amounts of energy when activated and require several large matter/antimatter reactors to function, which can be expensive energy sources.

Space Travel

A HaRP ZPE extruder is the most common energy source for large spaceships and functions as the main space propulsion system for these same stellar vessels. It works on the principle of extruding energy from a polarized quantum vacuum known as the electromagnetic zero-point field. Antigravity systems are based on the same principle and are used to cancel out zero G in space and generate a suitable environment for any humans' onboard vessels or in bases on low gravity planets. Matter/antimatter reactors are still used to power older installations and old-fashioned fusion technology is still used for smaller vessels.

Hyperlink Communication

The hyperlink network is based on Quantum Technology and offers secure and instant communication between two separated units. The only things that can slow it down are central

connection systems and relay stations where signals from one hyperlink are rerouted and transferred to another. Local Hyperlink Networks connect all the communication systems in a colony while Global Hyperlink Networks connect an entire world and Planetary Hyperlink Networks connect entire solar systems.

The Interstellar Hyperlink Network is the largest and most important network since it connects all the colonized areas of space. Space Gates function as main com-stations between colonies but the network also consists of deep space relay stations and bases left behind by Odysseus Probes, most of which are yet to be claimed by the first human that may finally arrive to the location.

Tools

In the future, humans rely very heavily on advanced field equipment to make their lives easier. Indeed, sturdy tools that can assist in various functions are vital to survival in the alien wilderness on Calypso. Settlers must be self-sufficient in their struggle to reclaim the planet, which makes the use of tools a vital part of life.

Tools are required in order to use certain skills successfully. Many others do not require them, but using the appropriate tool does improve the chance of actions being successful. As a result, having the right tool and the right skill is always an advantage.

There will be various classes of tools available and each type will also include a wide range of models with different functional standards and capabilities. New tools and models are always under development to provide the market on Calypso with an endless variety of optional hardware, which will create a growing multitude of tools from which to choose.

Meat Extractors [General Information]

These practical devices are used to extract pieces of meat from dead animals. They are primarily used as complementary tools for hunting and survival in the wild. All Meat Extractors are equipped with a safety function, which guarantees that the tool can't be used as a weapon.

MXL- 440

The MXL-440 is a standard field model using conventional laser technology to cut up and extract the meat before using an auto link to transfer the meat into the inventory. It leaves a minimum of waste, but the appropriate skill is required in order to operate it effectively. Like all Meat Extractors, the MXL-440 cannot be used as a weapon due to its built-in safety function.

Harvesters [General Information]

These devices are used to extract various forms of edible plants and crops from the earth. To avoid any risk of poisoning, all harvesters are pre-programmed with the current lists of plants that are fit for human consumption. The device will automatically reject any untested or unfit flora if the user targets any such plants for harvesting. Harvested products are automatically cleansed, processed and transferred to the inventory for easy storage and access.

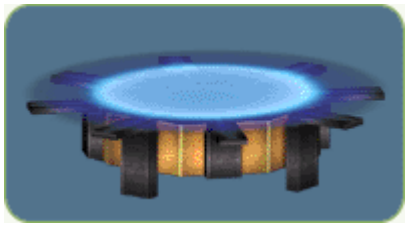

H-50 Farmhand Alpha

This is a standard model using a close-range teleportation system to harvest various forms of edible plants for personal use. It was primarily developed as a device for basic survival in the wild as well as an alternative to hunting.

Food Converters [General Information]

These are portable cooking devices that can prepare raw food in various ways, depending on the model. Its functions can range from just making raw food edible, converting food into more durable Food Packs or turning Food Packs into a variety of increasingly more nutritious meals.

FC-100 Food-Mate

This is one of the most basic field kitchen models. It's able to turn any type of raw food into cooked food, but it can't handle Food Packs. From this perspective it's more practical for experienced travelers who are used to gathering their own food in the wild as they go.

LS Medical Instrument Beta 1-X-1

Combat surgeons used this model on android soldiers during the robot war on Calypso. It was used for "beta treatment", meaning quick on-site surgery instead of "alpha treatment" which was the code for secure hospital treatment. The modern remake is lighter than the original version and operates without the need for an old portable ACM.

Mineral Excavators [General Information]

These devices are used to extract ore from the hard depth of solid mountain rock. Mineral Excavators are similar to basic mineral detectors, but much more powerful. They are equipped with a special teleportation system that is able to isolate the materials and then automatically transfer the ore into the inventory.

FP-500 Gold-Digger

The Frontier Prospector series is the first in a new line of high-performance models. The depth capacity is increased, which makes it able to extract more ore if the user is skillful enough to use the device to its full advantage.

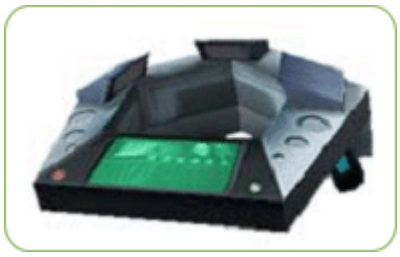

Mineral Detectors [General Information]

These small devices are able to detect various forms of mineral deposits under the ground surface. When an ore has been detected the device is able to lock onto it and teleport the mineral into the inventory. The Mineral Detectors are practical and easy to use but they have some limitations. They cannot reach down to larger mineral deposits deep inside mountainous solid rock and some ores are simply beyond its range. Excavation of this kind requires a more powerful and heavier device called a Mineral Excavator.

MD-027 Earth Worm

This handy piece of advanced electronics is considered the standard model of its kind. It has a good average performance with a few more practical functions than earlier models. It will first identify

the ore that it has detected before it's transferred to the inventory. This gives the user the choice of rejecting or accepting its findings. The device still uses the same teleportation system from the inventory PAC unit to extract the ore from the ground but this function is highly optimized by the MD-027 Earth Worm for maximum range and performance.

Mineral Refiners - [General Information]

Mineral RefinerThese devices are used to refine previously extracted minerals into pure bars that can be used for various construction purposes. Mineral Refiners use teleportation technology to separate waste materials from the desired mineral before its compressed into its pure form. The advantage of using a Mineral Refiner to transform the extracted ore into pure compressed mineral bars is that they weigh less than the unrefined ore, which makes them easier to carry.

MR-12 Meta-Maxx

This device is a standard mineral refiner with good performance. This model is a bit heavy to be a portable field unit because it has more sturdy electronic components in its refinement system. It produces no residue material because the waste material is automatically vaporized and removed.

Com-Pads [General Information]

Com-Pad systems differ from the standard computer implant, the NECI, by being essentially more powerful and considerably larger. This has led to a handheld computer version rather than the implanted form in order to keep the cost down on advanced nano-electronic components and avoid anatomical and neural integration problems. The device uses a direct remote uplink to the NECI implant, providing the user with enhanced functions such as deciphering and encryption capabilities. It is primarily used to unlock information from data units, hack into computer systems and download information.

PCE-50 Field Mate

PCE stands for Portable Computer Enhancement and are the most common series of Com-Pad models on Calypso. They are originally constructed as rugged field models for extensive use in any type of environment and were never designed as fashionable urban items.

DS/ARES-103 Panzer Probe

This model belongs to a series of standard defense scanners originally meant for military forces. ARES stands for Armor Rating and Energy Shield, which is what this device scans. After a successful scan the device will display an average of the current defensive value of the target. It makes up for its inability to display each type of defense separately by processing the data much quicker than other more advanced models that are equipped with detailed display functions.

LF-50 Multi-Scout

This standard all-around purpose field model has an average scanning range but can detect and track any type of known life forms, be it human, artificial, organic species or mutated creatures. The user only needs to specify the desired type of target and the device will scan the area for it. The LF-50 Multi-Scout is the ideal tool for any watchful traveler who wants to know what's moving around.

Defense Scanners - [General Information]

These scanning devices are able to read the defensive values of a target, such as current armor rating and shield status. It's meant to provide the user with vital information about the defensive strength of a potential enemy target before engaging it in combat. These sensitive devices can also scan natural organic armor such as thick hides, bone plating or exoskeletons. Unnecessary confrontations and resurrections can be avoided if this practical gadget is used in the right situations, making it an invaluable tool for smart survival inside any area with unknown hostile activity.

Life Form Indicators - [General Information]

This device is used to detect and track various life forms through the environment. This includes humans, robots, mutants, animals and other creatures. The device is quite advanced but the portable technology is relatively new, which presents certain practical limitations. As a result it still requires skill to interpret the data correctly in order to use these devices efficiently. A single scan can present quite an overwhelming amount of data, which is more than a single Com-Pad can handle. In this case, the human must rely more on his or her own experience with the device than on the sole aid of computers. A skillful user will not only be able to tell the direction and range of the target but also its name and even attributes. If used in the right way this device can detect trouble as well as help its user to avoid it.

Laser Scalpels - [General Information]

Laser ScalpelThis is a tool used for basic surgical procedures, such as artificial limb replacements and body or brain implants. The device is equipped with several surgical lasers that interact in various ways to perform external and internal surgery on a human body. The Laser Scalpel is automatically linked with the standard microcomputer implant, the NECI, for secure and optimal performance. It's also linked to the inventory, the PAC unit, allowing it to override this security system and use its limited teleportation capabilities to place implants inside a human body. It's a very sensitive tool and requires a great deal of time and skill to master. It's a highly specialized tool and cannot be used to treat or heal injuries.

VERSION UPDATE HISTORY

PROJECT ENTROPIA VERSION UPDATE 4.2

2003-01-28

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING STRANGE IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE APPROACHING PROJECT ENTROPIA SUPPORT! ***

Welcome!
The Version Update 4.2 ("VU 4.2") for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document. The VU 4.2 is scheduled for a release at the 30:th of January 2003.

VERSION UPDATE FEATURES

Participant versus Participant combat available
In a special area on the western shore of the continent of Eudoria (marked on the in-universe map) there is a special area where combat between participants is allowed. When entering this area the participant will be notified about the current status. Avatars are not lootable. The area in itself is quite valuable, with rare mineral deposits and uncommon creatures roaming round.

Personal Storage Facilities present
In various areas in Project Entropia each Avatar has the ability to use a Personal Storage Facility. This functions as a safety deposit box, in which you can store items of your choice. Certain items may not be placed here, namely Blueprint books, Deeds, the PED Card, Exchange certificates, and the orange starting clothes. The maximum amount of items that can be stored is at present limited to 500 items. A single stack of several items counts as one item in this Storage Facility. The Storage Facility is currently free of charge.

NOTE: In the next VU (4.3), the weight allowance will be reduced on your Avatar. Therefore we urge you to maintain a reasonable number of items on your Avatar. Also remember that a smaller inventory will increase performance and load times across the board.

Avatar look redesign
All old participants have the option to redo their Avatar looks. The Avatar will keep all items and skills. To keep the old Avatar look just press "Accept" without modifying the settings. You will also be able to change your Avatar name. PLEASE NOTE that the name chosen is indeed your Avatar name, not your personal name. Also note that titles and ranks will soon be implemented in Project Entropia, reducing the need for entering such "names" as Avatar names. The Avatar name CANNOT be changed after it is entered and accepted.

Hall of Fame updated
The Hall of Fame ("HOF") has been updated. A new area of fame is the crafting section. The HoF is also split in two sections, one for "All Time High" events, and one that shows the greatest effort of the last 24 hours.

Exchange enhanced
Several updates and enhancements have been made in the Project Entropia Exchange. Better

information is available, and the interface has been tweaked for better understanding and functionality.

Skills are rated
Each skill has an individual rank associated with it, indicating how good an Avatar is in their respective field.

Skill experience tweak
The rate at which an Avatar gains experience in his or her skill levels has been set to the correct level.

Skill icons
The skills interface has new icons, making it easier to find a typical skill.

NPC:s populate Project Entropia
In various location there will be NPC:s (Non-Participant Characters) present, doing their thing.

Enhanced transfer capabilities
Several enhancements in the Bank Interface while transferring money from a real life credit card to PED:s have been made. Many of the problems with getting the now infamous “Internal error” message have been eliminated.

Limit amount of items per transfer
The number of items you can transfer in a Trade Terminal is limited to 40. A single stack of items (for example ore or ammunition) counts as one item.

Blueprint books tradeable
You can now trade and sell blueprint books.

Drop Confirm dialogue box
Every time you try to drop an item you have to confirm it.

Monsters drown
After a short while below water the monsters not ordinarily living in water will drown. Drowned animals will not drop loot.

Clothes
More various clothes are present in Project Entropia.

Faster Society functions
The technology running the Societies has been updated and should not take as much time as before accessing it.

Attributes Rating Values Fixed
The avatar attributes (Strength, Agility, etc.) were shown wrongly on the client. The correct values are now shown.

Invisible weapon accessories now visible
Weapon accessories, like scopes, laser sights and amplifiers, are now shown correctly.

Weapon decay mismatch fix
In some rare instances the value of a weapon was shown differently from the time you last logged out of Project Entropia, compared to the next time you logged in. This has now been resolved, and the correct value is always saved on the server.

New client loader and login screen
Project Entropia has a new leaner and more capable client loader, updater and information viewer.

Resumable downloads

The auto-updater utility keeping Project Entropia current has received an added resumable download capability. This means that if the connection should fail during a download, once you restart it, you will begin downloading the files from the point the connection failed.

New firewall ports
Sometimes the participant can't connect to the Project Entropia Virtual Universe because of their firewall. Opening the following ports in the firewall you use can easily solve these problems:
· 20, 21 (TCP outbound) - Additional TCP port outbound for passive mode FTP
· 30584 (UDP inbound/outbound)
· 30592 (TCP outbound)
· 31111 (UDP inbound/outbound)

Newbie Guide online
On the Project Entropia web page there is a newbie guide present to educate newly arrived colonists about Calypso of what to expect and how to use Project Entropia, while downloading the client software.

Exploit Information Reward System active
At the Support section at www.project-entropia.com a new Exploit reporting category has been added. Participants who encounter "exploits" (bugs that can be manipulated into cheating) and report these to MindArk can be rewarded with up to 1000 PED:s.

KNOWN ISSUES

Radar is not updating all the time
Yes, we know. It has become better though. It will be completely fixed in the future.

Yes, you can run through trees
This is not a bug.

Missing icons on clothes and items
On certain PC configurations sometime the item icons in the inventory become invisible, or you receive a dummy icon called "Unable to show". If this happens to you, please update to the latest video card drivers, check if Project Entropia officially supports your video card, and also change the video settings on the Setup button in the initial login screen. If this fails, please contact the Project Entropia Support.

Background music causing Crash To Desktop ("CTD")
Sometimes a bug in mp3 decoder system causes the Project Entropia client to crash to desktop while playing a music file. If you experience a lot of CTD you could try to completely shut down the music in Project Entropia using the Options Interface.

PROJECT ENTROPIA VERSION UPDATE 4.4

2003-04-03

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING STRANGE IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

Welcome! The Version Update 4.4 (“VU 4.4”) for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document. The VU 4.4 will come within a few days.

VERSION UPDATE FEATURES

Auctions

Auction houses and independent auctioneers have been added throughout the continent of Calypso. These points of trade will increase the commerce between participants and societies. Everything that normally can be traded between participants can be traded on the global auction market.

Enhanced Communication between Participants

Several enhancements have been made to ensure secure communication between participants. A new special Society tab has been added for intra-society communication. A “Friends” list has also been added, in which a participant can add friends to and chat with them directly if they are online, regardless of distance. All messages sent and received through the Friends-list are also saved in the client folder, in a file called “FriendChat.txt”. Clothes Making The avatars now can make clothes using raw material from the fauna of Calypso. The system works a lot like the construction system with raw material, a blueprint of the design one wants to make, and a special machine for performing the action.

Colorize

Participants can also colorize their newly created clothes to suit their own style and feeling.

Added Uniforms

Official MindArk representatives present in Project Entropia will have distinct clothing showing they are officials. Also, several of the NPC traders have received special clothes.

Avatar Information Sheet Present

A new section displaying the Avatar skill, skill levels, skill ranks, and skill XP has been designed. The section also has info about the avatar name, social status and professional standings. This information section has also been prepared for future implementation of avatar reputation, fame and credibility, as well as background, trivia and statistics.

Added Boxing Ring

Boxing rings have been added. These work like limited PvP areas where combat can take place. The rules are set by the participants.

Added Production Platform

An Omegaton Survey Probe Ship has dispatched an automated production platform. This platform has gone missing and Omegaton has even denied any knowledge about its whereabouts. Rumor has it that it indeed functions and is pumping crude oil out into the open, free for grabs!

Added Catwalk

A catwalk stage has been built just outside the fashionable Nymphtown, to enhance fashion shows, dance competitions, and other kinds of entertainment.

Added Range Information to Items Info
The items info view port now displays the range for all ranged weapons.

Changed Condition Function
Items now stop working at a condition of 10%, instead of 0% as before.

Several Updates in the Skills Section
Many new skills have been added. More details are also now available on the descriptions of several skills.

Fierce Monsters
Several monsters have evolved on the Calypso surface.

More Items
The stock of items present in Project Entropia has been expanded, with new weapons, armors, tools, and other items.

Added Support for Credit Cards
The Project Entropia Bank now has support for Visa once again. In the future, Diners Club, and American Express cards will also be supported. NOTE! THE VISA FUNCTION WILL COME ONLINE A FEW DAYS AFTER THE ACTUAL VU IS RELEASED!!

Robots are Gaining Strength
While attempting to strike at Calypso settlements several times already, the robots have something else up their collective sleeve. Some unconfirmed data reports at least one new type of robot never before seen.

Support for DirectX 9 Implemented
Project Entropia now has DirectX 9 support. Please note that from this update forward, Project Entropia requires Microsoft(r) DirectX(r) version 9.0, which can be obtained from Microsoft's official site: http://www.microsoft.com/windows/directx/.

New Entry Points for Newcomers
Newcomers to Calypso will find themselves closer to civilized areas.

New Sound Engine
Project Entropia now has a completely new sound system in place, which will grant Project Entropia much better options using sound and music as mood enhancers and to create cool effects.

Ghost Jumping
The restless soul of a dead Avatar can now jump.

General Updates to the Client Software
Several fixes and updates have been performed on the Project Entropia Client Software to increase stability and performance.

Client Error Messages Updated
The error messages given to participants when they fail to connect to Project Entropia have been updated and are streamlined.

Zombie Creatures Be Gone
The problem with “undead” creatures striking back after they have been killed has been fixed.

Rebalancing
Almost every system has been reviewed and rebalanced somewhat.

KNOWN ISSUES

Yes, you can run through trees. This is not a bug.

Missing icons on clothes and items
On certain PC configurations sometimes the item icons in the inventory become invisible, or you receive a dummy icon called “Unable to show”. If this happens to you, please update to the latest video card drivers, check if Project Entropia officially supports your video card, and also change the video settings on the Setup button in the initial login screen. If this fails, please contact the Project Entropia Support Team.

Tab key does not work
The function of the tab key has gone missing.

Society chat and Kicked Out Members
When a society member is kicked out of his or her society, the former member is still allowed to use and listen to the Society Chat messages, until the former member logs off Project Entropia.

Reverb
Project Entropia now supports environmental effects set in applications like Creative(r) Surround Mixer(r). If you experience exaggerated reverb effects in Project Entropia you should check your surround mixer settings, and disable “game effects” if necessary.

SPECIAL

Scan
The first time you scan an entity in Project Entropia after VU 4.4, your will transfer your level in “Enemy Scan” to the four skills “Scan Human”, “Scan Animal”, “Scan Robot”, and “Scan Mutant”. The skill Enemy Scan is removed. For example: You have Enemy Scan level 50. The first time you scan an entity you will gain level 50 to “Scan Human”, “Scan Animal”, “Scan Robot”, and “Scan Mutant”.

PROJECT ENTROPIA VERSION UPDATE 4.5

2003-04-09 – (**Source:** http://entropia-pioneers.kicks-ass.org/ep/viewtopic.php?t=251)

On our light-board here at the office, the motto for 4.5 is up. It reads:

"Lag kills. Defeat lag."

It will be a challenge. Really. But we have lag as the number one issue to solve, because it has ripple effects into every other system. Content will be next to nil in 4.5 - almost every resource we have is working on fixing the lag problems, may it be server lag, client lag, memory usage, memory leaks, whatever.

For some other disappointing news, the technical manager has determined that there is not enough resources available to apply external testers to the inhouse servers in time for VU 4.5. I will try to continue persuading him, but I think it will be hard.

2003-04-25 – (**Source:** http://entropia-pioneers.kicks-ass.org/ep/viewtopic.php?t=358)

A quick update - the lag reducing efforts are being tested inhouse, and moves along nicely. The main area that is addressed is rubberbanding, synching between client and server and primarily that kind of lag. We have also reduced load on the databases. Login and logoff is also sped up.

Minor areas in 4.5 is the client lag when entering cities (which lag due to data being loaded from your harddrive) and when many avatars are in view. These areas will be better, but the big improvements there will be in 4.6, or later.

Updates in the auction are being done. It is mainly bugfixes and no new functionallity.

The main content part of VU 4.5 is the ability to team up and share loot.

VU 4.5 will come in two parts, with about a week of each other, in the first half of May.

Lag has been pretty bad the last few days. The reason for this is a great influx of new participants. This makes the 4.5 VU even more needed.

Lag Kills! Defeat Lag!

PROJECT ENTROPIA VERSION UPDATE 5.0

2003-05-05

Hello! Its great to be back! I have annoyed the devs to gather info about what is going on. Many of you have questions about the VU and stuff.

Version naming
As the next update is a great architectural change compared to Project Entropia right now, the next VU will be called 5.0. The content part will be called VU 5.1. ETA of next Version VU 5.0 will come around the middle of the month, give or take. VU 5.1 will arrive roughly a week after VU 5.0.

What is in VU 5.0?
No content whatsoever. VU5.0 is an architectural change (or re-write, as some of our veterans may remember, as we changed the communication system between the servers last fall) in how the server actually behaves in regards to synching between client and server, how the priorities in data handling and how the server makes better use of its time.

Previously several systems where affected by the simple fact that an Avatar was logging in, and this made the physics system (the system that takes care of synching positions, movement etc) freeze for up to a few seconds (other areas where also affected with these freezes, making rubberbanding a painful fact). The server was effectively "locked" from action while this happened. This is removed in VU 5.0. It was not an easy task to do, and there will probably be some initial bugs but the way it has been done, we can make updates quite fast (without any serious downtime), if needed.

These "freezes" was the fact that made the rubberbanding an heavy issue when a server was full of Avatars moving around - the physics system did not have the time to make accurate updates. To summarize - the rubberbanding should be lessened by a great amount once VU 5.0 is applied. Minor areas that are also improved by this change is login and logoff time, as well as some transactions and database operations.

What is not in VU 5.0?
We have another area that causes "lag". That is the streaming of buildings, Avatars and items (like when you approach an Outpost, the harddrive is busy loading models and textures, and this causes “lag”). Another is when many Avatars are in your own surrounding, as they are also streamed to your client ("streamed" as in data loaded from your harddrive - not as streamed over the Internet). These areas has not been updated in VU 5.0. They are next inline for major updates, and the tech guys say that they should be ready by VU 5.2 (scheduled about one to one-and-a-half month after VU 5.0). By VU 5.2 many sources of the now infamous (and extremely annoying) CTD (crash to desktop) problems should be eliminated.

Bomb Reimbursement
While I was away the Bomb Reimbursement Programme was performed. This was the programme where a participant while mining blew up an entire stack of bombs instead of a single bomb. Nothing else. Probes has not been reimbursed yet, but will come. If anyone feels that they are affected by the above problem and has not been given their bombs back (check your Storage Terminal), please contact Project Entropia Support.

Random amount of PEDs, PECs, and ammo in the Storage Terminal
Once in a while you may find money or items in your storage terminal that you do not remember placing there. This is often due to lagginess in the loot system, and the items are then placed in your

storage terminal.

The Merge bug on the 28th and 29th.
Those that lost ammo and other stackable items during the above time period due to the merging bug will get their items back as soon as the analyzis and Programme has been finalized. I have no ETA on this, though. It is a great amount of logs and database records that needs to be verified and cross-checked, thus it takes a lot of time. Please bear with us on this.

Ideas Forum
I will this week make comments on the ideas in the Ideas forum. I do read them, but I believe that the lack of feedback from us is frustrating. Therefore I will be more active in that board.

Auction problems - items invisible
There are instances where auction items are placed in the avatars inventory, but is not updated correctly, thus not showing to the participant. We are aware of this and an investigation is at hand. This is going to be corrected.

PROJECT ENTROPIA VERSION UPDATE 5.1

2003-06-13

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING STRANGE IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

Welcome!
The Version Update 5.1 ("VU 5.1") for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document. We are still heavy at work with the mission to reduce lag and increase performance. In the upcoming VU 5.2 the new Item Management System will be in place, and once it is, we envision that all problems correlating to items will be solved once and for all. This release will make way to this major upgrade.

Please check the Known Issues section in the Support section on the Project Entropia web site for current issues. Also, the best place for up to date info about what is going on is the Project Entropia Developer's Post forum on the Project Entropia web site. VU 5.1 is expected to arrive around the 20:th of June. The date may change though.

VERSION UPDATE FEATURES

Attachment crafting level 6-10
Attachment crafting on level 6-10 is in, together with the associated components needed. At the moment none of these designs require Lysterium. ,-)

The Project Entropia Newcomer Shuttle Port
Just south of Port Atlantis the Federal Empire has built a Shuttle Port, where all newcomers arrive when coming to Calypso. This area has information booths available, giving the basics of Project Entropia.

Project Entropia Transfer Center
The old Project Entropia Bank is replaced by the new Project Entropia Transfer Center.

New deposit option
For those who do not have a credit card a new pay-by-phone option is implemented in the new Project Entropia Transfer Center. Just pick up the phone, dial a number, and you get PED to your avatar, while your phone bill is charged.

Avatar Trivia and Avatar Background
The avatar has the possibility to make a personal presentation of himself in the Avatar Interface that will be visible to other Avatars.

Rebalance success rates while crafting and mining
Generally you will succeed with your action more often, but the output value is reduced.

Rebalanced skill advancement
Several skills now have a higher increase rate, mostly those that have less skill checks per time frame. This mostly affects mining and crafting, and does not affect hunting much.

Rebalanced attribute advancement
The attributes now increase in greater steps than before, especially at lower levels.

Possibility to learn from mistake
When failing using a skill the avatar still has a small chance of raising the skill.

Dynamic XP message
The XP gain messages have been updated somewhat.

Society in target square
When targeting an avatar the society the avatar is a member of will show in the target square.

Feedback on 15% Condition
When an item is deteriorated to 15% of its full Condition a message will tell the participant it's a good time to consider repairing the item.

Recharge delay bar on melee weapons
When using a melee weapon a delay bar will show when the weapon is ready for use again.

What killed the avatar?
When being killed the avatar will get a message in the chat window that says what killed the avatar.

Trader NPC's have "uniforms"
All the trader NPC's (Technician, Auctioneer, etc) have similar clothes as other NPC's of the same kind, to distinguish them more easily.

Change of stock in the Trade Terminal
The Trade Terminal will have new weapons available, the Omegaton M2200 and the Sollomate Busho.

New weapons
New weapons are added.

New tools
New tools are added.

New armors
New armors are added. Shadow is no longer king of the hill. ,-)

Updated component names
Several components have name updates, mostly the word "Parts" have been added.

NPC's are talkative
Several NPC's have a lot more to say.

New NPC's / Monsters
New species will inhabit the continent.

Tougher NPC's / Monsters
Bigger, meaner and more dangerous forms of already existing npc's will appear.

More NPC's / Monsters
Despite all hunting the numbers of existing monsters is steadily growing

The NPC's / Monsters will make more sounds
Several new sounds have been implemented on the NPC's / Monsters.

NPC / Monster AI is optimized
Several of the Monsters have new AI controlling them. Expect less passive monsters.

Lost ruins
Somewhere on the continent a ruined city has been found. Unfortunately the coordinates to its location were lost in the transmission.

Minopolis
The new city of Minopolis founded, located some distance north of Nymphtown. This is a city designed in a new way, with a more distinct look than the old outposts. Several of the outposts will soon grow to new looks.

Added facilities to outposts
Storage terminals and auctioneers will be present in more outposts than today.

New looks of the old outposts
Several outposts have new looks.

Changing skies
The first step in the future Weather system is in place – the sky will change depending on where you are on the Eudoria continent.

Items in auction
The avatars will always see the items they select.

Healing is reduced when moving
If you are trying to heal using a medkit when moving the result will be diminished to about a quarter of the normal heal rate.

Deterioration per use
Weapon attachments now have the correct "deteriorate per use" set.

New animations and sounds when dying
The avatar can now be killed in more varied ways than before.

New animations and sounds when using melee weapons
New animations and sounds added to a variety of melee weapons, most notable on the powerfists.

Leader becomes founder
Prior, the founder of a society was titled "Leader". This is changed to "Founder".

None becomes Freelancer
Prior, an avatar not a member of a society had society rank "None". This is changed to him or her being "Freelancer" instead.

New music
A lot of new ambient music has been added.

Skill management system changed
The skill management code has been optimised to increase performance. This will decrease the strain on the systems, and will reduce the login and logoff times.

Several performance / lag fixes
Many steps have been taken to increase performance and to reduce lag. We are still in the process of making several heavy upgrades, which will come in VU 5.2.

Audio system
The audio system is optimised.

Database
The database is optimized. This will help performance, until the major re-write of the item management system is implemented in VU 5.2.

SPECIAL

The below is currently tentative, and might not make it to VU 5.1.

Teams
You have the opportunity to form temporary groups with other avatars. You will see the other team member's health status. A series of click-commands are also in place. Loot distribution is automatic within the group, and every member has full insight on what is going on. Items will be distributed randomly among the members, while stackable items are split as evenly as possible throughout the group.

PROJECT ENTROPIA VERSION UPDATE 5.2

2003-10-15

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING STRANGE IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 5.2 (“VU 5.2”) for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document.

VERSION UPDATE FEATURES

SYSTEM UPGRADES

Item Management System
The Item Management System of Project Entropia has been extensively upgraded. This means that the internal system handling all items and transactions has been upgraded, to increase performance and to reduce the number of issues occurring in regards to item manipulation. As Project Entropia is built to utilize maximum security, all item manipulation and trades are conducted on the secure server, before the client shows what’s going on (the Project Entropia client does not hold any vital data whatsoever). This has sometimes caused confusion, as the client predicts actions. These predictions have sometimes shown incorrectly on the client, even though everything is perfectly okay on the server. The most common area where misunderstandings occur is the shown ammunition when quickly logging off and logging on again. One obvious change is that the participant may notice some of his or her items become ”faded” into a blue-gray icon when moved. This means that the item is currently being handled by the server and cannot be manipulated until the server says so. This has always been the case, but before it was not shown to the participant.

Inventory
The inventory functions have been revamped. One of the areas that has been an issue for participants using slow connections is synching of items between the Project Entropia Servers and the client software on the participant’s own computer. The major reason for participants’ timing-out, crashing, starting with ”no inventory in newbie clothes”, etc was due to the sheer number of items in the avatar inventory.

Even though no real problems were derived from this, it caused confusion. Therefore, we have made several upgrades to reduce this behavior. One major change is the introduction of ”container” items, which are boxes, cases, chests, etc in which items are stored. The system only synchs items between the server and client that are in the currently used container, meaning that a participant will not experience long load times while logging onto Project Entropia, but will experience somewhat longer load time while manipulating cases of different kinds, as the containers are synched when accessed.

With the containers, the synching of items has been distributed to many different areas, instead of one giant area. Please feel free to put seldom-used items in a special container and leave them be – then that container won’t use your connection or disturb your load times. In future releases more types of containers will be implemented, even such that will bring a reduction to the weight carried in it. At the moment a participant cannot drag items to a closed container, but must open it to place items inside.

An inventory can at most show 500 items. More items than that in an inventory will render the additional items invisible. MindArk strongly recommends that participants restrain themselves to have inventories with max 200 items. More items will cause performance hits on you, loss of connection and possibly other strange effects, especially if you have a lesser connection (below 2Mbit) or have an ISP of lesser quality.

Auction
The auction system is completely redone to eliminate the issues with ”stuck items”. Also, the interface has been redone to utilize for much meaner and leaner operations. The new auction has a fee of one PED for each item put on the auction, to reduce ”Spam”. When VU 5.2 is applied, all current bids are nullified and returned, and all items offered are also returned to respective participant. The new auction will therefore be completely empty directly after the VU 5.2 is applied. Another area that is upgraded is how transactions in the auction are handled. Instead of the participant needing to visit the auctioneer to get the latest info, all such messages are handled in real time. If a participant is offline, the message will be stored until he or she logs on again. All money is also transferred the moment a change occurs. The only thing that has to be manually collected is an item won.

Crafting
As stated above, the major reason for having performance problems is due to a high number of items. One of the most cumbersome areas is crafting, or more specifically, the blueprints. Therefore there have been changes to the crafting system. The number of unique blueprints has been reduced to about half, and some crafting categories have disappeared (Tool, Weapon, Armor, and Attachment Components, and Tailoring Materials) completely. The associated skills have also been removed. Some skills have also changed name (the old “Assembling” skills are now called “Manufacturing” instead, and the old “Manufacturing”-skill are removed). Those who have blueprints and/or skills in these areas should read the ”Compensation” section, below, before contacting MindArk. The crafting system overall has been changed in that way that there are no longer any overlaps between lootable items and craftable items. All craftable items are craftable only.

Therefore, a whole range of new craftable items is introduced. With this, several new minerals and EnMatters have been introduced as well. Tailoring now works more like the rest of crafting. You have a raw material; you use a refiner on it and get a refined piece of material you can use together with a blueprint to make clothes. The Manufacturing Interface is also revamped, and more logical than before.

The participant is also informed on the relative chance of success, based on skills, blueprint QR and the level of difficulty. Overall, the crafting system is somewhat easier to manage, with fewer steps needed from start to finish. We are very much aware of that this is a major change and can feel like a letdown for some participants. This simply had to be done; otherwise the crafting area of Project Entropia would hamper performance across the board for every participant.

Compensation
There is an automatic compensation system in place when you load up Project Entropia the first time after the VU. If you are entitled to any compensation you will receive messages to that effect. Obsolete blueprints and components will be changed to current blueprints (with QR 1) and into minerals. Items/money stuck in the auction will be returned to your personal storage facility. Also, those affected by lost Quality Rating (including QR on converted blueprints) will be reimbursed for this, in a compensation system, where the participant can select which kind of compensation he or she desires. In this compensation system obsolete skills are also taken in consideration.

PCGamer Quest
Those participants that joined Project Entropia through the client distributed on the PCGamer (US)

edition also have a special quest available.

MIXED FIXES/UPGRADES

In no particular order:

- If you lose connection to the chat server the system automatically tries to re-logon, without the need to re-logon Project Entropia.
- Added a connection indicator in the client. A three-lights display is located by the radar. If the load is light, they are green. If the load is heavy, it changes to yellow, and if the load is high, it changes to red. This display is updated a couple of times per minute.
- Added functionality to the Friends-list, indicating when friends come on- and offline.
- Added new, more Asian looking face textures to Avatar Creation Interface.
- Upgraded the performance substantially in the Fast key Interface.
- Added new music and sounds.
- ”Nothing to loot here” – The frequency is reduced, but you will still encounter critters with no loot. It’s not a bug.
- Updated an instance where client-to-client synch mismatched in PvP Trade.
- The Hadesheim Siren is now silenced when no attacks are in progress.
- Updated functions when stacks are split, to show more accurate info in the client.
- Update the servers extensively to reduce lag and performance slowdowns.
- Several new items added, especially high-level equipment.
- T-key changed to move stuck avatars to a random location, instead of a fixed.
- Fixed so newbie clothes should not multiply.
- Fixed an issue with claim deeds not being removed after deposit was depleted.
- Updated the defense turrets.
- Updated that both parties engaging in a PvP Chat gets automatic focus in the Chat window.
- Fixed an issue with blueprints weighing double if inserted into a blueprint book.
- Fixed an issue with items picked up from the ground weighing incorrect.
- Fixed a minor issue with the selected title being reset to the top one in the Avatar Information interface with each login.
- Fixed an issue with being able to vote multiple times in the Vote Booth.
- Fixed an issue where uncolored clothes could not be used in the Coloring Interface.
- Further secured the Trade Terminal Interface.
- Upgraded how the teleporters behave if the system is under heavy load.
- Upgraded the looks and functionality on the various Loot Interfaces.
- Empty blueprints books are now sellable.
- Fixed issues in the Repair Interface when using the quick-buttons (not making items un-accessible anymore).
- Quality Rating on Blueprints associated with Value, meaning that Value will rise with higher QR, to the max of one PED at QR 100.
- Fixed an issue with a full inventory covering buttons in the auction.
- Fixed an issue with current value/condition not always showing the correct amount in the auction.
- Several upgrades of functionality in the PvP Trade Interface, most noticeably the removal of ”Cancel” functionality once ”Accept” is pressed. You may however cancel once the order confirmation is presented.
- Clothes and armor with a value/condition of zero are not wearable (exception: newbie clothes).
- The autofire bug (the weapon could uncontrollably fire due to an ALT+TAB change) is eliminated.

- Fixed an issue with the PED Card while withdrawing PEC, making the PED Card crash.
- Fixed an issue with ever-active decoys.
- Corrected a client bug when merging two full stacks, one stack would go missing.
- Corrected some tool tip errors.
- Added more detailed error messages for rarer instances.
- Fixed an old issue that allowed avatars to chat even while dead using the Focus button.
- Fixed various graphical glitches.
- An avatar should only have one set of newbie clothes.
- Many items have enhanced looks in Items Info view port.
- Fixed a potential issue with the mouse pointer focus changing when someone requests a PVP Trade or PvP Chat. The pointer does not automatically change to pointer mode now.
- Fixed ”leveling” of blueprint books (visual leveling).
- Enhanced the Trivia/Background info.
- Enhanced the messaging when leaving/entering PvP zones, to ensure the message is displayed.
- Fixed the prefix elimination on ”Uncolored” clothes when colored.
- Fixed an issue with commands being sent to the Main Chat instead of the PvP Chat.
- Fixed an issue with NPCs just spinning round and round.
- Rebalanced success rates while crafting and mining. Generally you will succeed with your action more often, but the output value is reduced.
- Rebalanced skill advancement. Several skills now have a higher increase rate, mostly those that have less skill checks per time frame. This mostly affects mining and crafting, and does not affect hunting much.
- Update to the PvP Chat informing the other party when the first party left the chat.
- Fixed so the Avatar busy message is shown correctly.
- Updated the boxing ring bell to have a two second delay.

KNOWN ISSUES/MISSING FEATURES

In no particular order

- You can’t repair a weapon with attachments attached to it. You have to detach them prior to repairing.
- Currently, the virtual companies on the Exchange don’t offer any shares.
- The drill tower cannot be accessed. The minerals within it will be transferred

29 Oct, 2003 – (**Source:** http://entropia-pioneers.kicks-ass.org/ep/viewtopic.php?t=2914)

VU 5.2.1

Hello crew, Today’s update was a minor bugfix-update. Most noticeable is the increased spawn rate for the new minerals, and the completely new Support Section. The PE web page and Support is a work in progress and have some glitches right now, it will be fixed the following days.

For those of you who get an error when watching - this is due to an updated DNS entry (meaning that the pages are now at a different address, and the servers on the Internet that act like "phonebooks" sometimes are slow to update this info). Please familiarize yourself with the new Support section. Mail to Support will still work, but will soon be shut off. You get the picture when you browse the new Support. You may change your login the first time you enter info into the Account info. Please note that the account info given here is for everything you do with PE and/or MA. This update includes several lag fixes, but we still have some lag monsters that needs to get killed.

The devs have found a major culprit and will annihilate him as soon as possible (even if it might

take a while). In the future, the annoying "overweight when logging in" bug, as well as the "HoF strangeness" bug, will be fixed. A note to miners, some resources expiry dates acts up, showing strange data (like expiry on the year 24567). Such deposits should be extracted as fast as possible, as they may disappear within a minute’s time.

PROJECT ENTROPIA VERSION UPDATE 5.3

2003-11-24

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING STRANGE IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 5.3 (“VU 5.3”) for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document. --

VERSION UPDATE FEATURES

Housing system
The first version of the PE housing system is in place! Several small communities have been set up for future buildings. You can acquire your own house by bidding on the corresponding lot deeds in the auction. The lot deed’s item info (right-clicking on the deed) shows the location of the lot and house. You may also store items safely in your house. In the next VU’s the system will be enhanced and will allow an almost complete customizability. The supply of houses on Calypso will be quite limited, and we will not litter the countryside with houses.

Space travel
The initial steps has been taken in the quest of personalized space travel.

Interactive content
In PE there you can now find the first of a series of puzzles, or “quests”, requiring in-universe manipulation of items and scenery. Search and find out!

Map
The map is updated with the new house communities, as yellow dots. If you hover the mouse pointer over one of these, you get a tooltip displaying the name of the location.

Mindforce
Mindforce is introduced! The first version is in, allowing for the use of extra sensory powers. You need a Mindforce implant to use the Power chips found here and there. To activate a Power, you need to have it in your fast key interface and use the corresponding F1-F12 key. One Mindforce can be used without any equipment though, and that is the Sweat gathering skill. If you have nothing equipped in your hands, you may use this power. The requirement is that you are close to the creature you want to extract its fluids from.

New EnMatter
A new Energy Matter is available, which is one of the two parts of making the Mind Essence energy needed for using Mindforce Powers. You combine this EnMatter with the other part in a EnMatter refiner to make the Mind Essence.

Crafting Equipment
Some of the “Equipment” crafting (Mechanical, Metal, Electronics) material have been updated to be used at various places on Calypso.

Skills
New skills have been added in the Mindforce section of the Avatar Information Interface.

Fast key
The performance of the fast key system is enhanced.

Friends chat
If you receive a message from a person not on your Friends list, you now get the info that the person isn't on your list, as well as you see who it is.

Server load indicator
The Server load indicator is upgraded to more actively show the system load. A indicator in the reds may indicate that the system might be heavily loaded, and can affect the experience. However, this is not an exact indicator.

Avatar weight calculation
An error in the avatar weight calculation when logging on has been fixed.

Decoy
An issue concerning decoys and logging off has been corrected.

Teleport stacking
Sometimes when several avatars teleported to the same place at the same time, they got stacked on top of each other. This has been fixed.

Containers
Several minor glitches with containers have been fixed.

Lag/stability fixes
Several server and client updates have been applied to reduce lag and performance slowdowns. The system login process is enhanced, as well as how a participant performs – an avatar performing a lot of activities may experience "lag" him-/herself, but other participants do not get as affected as prior to VU 5.3.

Nude avatar
By manipulating the inventory interface, you could make your avatar nude. This has been fixed.

Spelling errors
Spelling errors have been fixed.

KNOWN ISSUES/MISSING FEATURES

- You can't repair a weapon with attachments attached to it. You have to detach them prior to repairing.
- Currently, the virtual companies on the Exchange doesn't offer any shares.
- Sometimes attachments may detach from a weapon when logging on.
- The Team chat is not always initiated when the Team Leader invites the first member.
- Some kind of items cannot be placed in a house.
- Hall of Fame does not display time correctly in the 24 hours section.

PROJECT ENTROPIA VERSION UPDATE 5.4

2003-12-17

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 5.4 (“VU 5.4”) for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document. --

Update Personal Info
You must update your Project Entropia account info through the Project Entropia Support section. Logon using your standard Project Entropia Login and Password. Account with faulty information will be locked down and a dialogue will be initiated with the person handling the account.

Old Support Mail
In VU 5.3 a new Support Section was launched, which is available through the Project Entropia client and through the Project Entropia web page. Now when this new system is up and running all future communication/support inquiries will go through the Project Entropia Support Case Center (“PESCC”). This means that old unresolved matters that was supplied using email needs to be entered by the participant into the PESCC to be attended by the MA Support staff. --

VERSION UPDATE FEATURES

Christmas season
MindArk continues the tradition started last Christmas, with presents to the active and contributing participants.

Enhanced Manufacturing
Added the Apprentice Level of manufacturing weapons, armor, and clothes.

More weapons
Some 100 weapons added to Project Entropia, of various performances. Among these several new models are introduced, like a dedicated BLP Submachine-gun. Several of these weapons are manufactured, even various BLP rifles.

More armor
Almost a dozen new armor sets added, including the new “Undead”-series.

More clothes and accessories
With the enhanced level in tailoring several new kinds of clothes can be found and/or made. A tailor may now make coats, jackets, miniskirts, boots, hats, shades, etc.

Coloring re-vamped
The coloring functionality changed to be clearer. It now shows the Chance of Success (as in Manufacturing) of coloring an item to best possible output.

New paints added
Several new paints have been added, allowing for even greater variety of participant-colored clothes.

Chance of Success update
The various levels of feedback when the Chance of Success is displayed (currently in the Manufacturing Interface and the Coloring Interface) has been split up into more steps, meaning you will see a more rapid advancement to your chance of success.

Skill increase changes
Skills related to the Mining and Manufacturing areas have received enhanced increase rates.

Blueprint acquiring
The chance of getting a new blueprint while manufacturing is enhanced. The chance of getting a blueprint that can be bought from the Trade Terminal is removed.

Added Mindforce
Several Mindforce upgrades added, as well as a completely new Mindforce power.

Project Entropia Smart Card Verification system
Are you sure that your personal computer is clean from viruses and key-sniffing hacker tools that is gathering data, passwords and other personal information? In a world where malicious intrusions on home computers are more and more common, one cannot be too secure with sensitive information. Add an even higher level of security to your Project Entropia account with this Project Entropia Gold Member Smart Card Verification system. With this combined Smart Card and Smart Card Reader your Project Entropia login procedure will have a level of security equal to the most secure real life banks. The Smart Card includes a personalized CPU Unit that creates a unique verification password each time you logon to Project Entropia. This means you never use the same password twice, rendering unwanted attempts to acquire your password obsolete.

Become Lord of the Manor - A castle is available!
Who will be the proud owner of the Calypso Castle?

More functions added to Hangars
Are you one of those with a pioneering soul and lust to reach the stars above? Space has never been closer.

Portable terminals
There are now portable terminals available, that can be placed where the participant feels is a good spot. Remember that placing an item out in the open means that anyone can pick it up though, so be advised to place it in a secure location, like a house. To access a portable terminal, you need to SHIFT+Right click on it.

House decorations
Several new ways of personalizing your house is introduced.

Increased some mineral availability
Some of the rare minerals and enmatters have become somewhat less rare.

Updated Drop functions
The Drop Item request is updated to inform about the fact that anyone may pick up dropped items. Also, when dropping items, the item is placed below the avatar position, positioned in the same facing as the avatar.

Merge of skills
The skills “Make Pants” and “Make Shirt” have been merged to “Make Clothes”, and the old skill levels have been added up.

Hall of Fame
The Hall of Fame 24h section is updated.

Fixed a mismatch of Tailoring blueprint level in Items Info

Some tailoring blueprints showed as having level one when they indeed had a higher level.

Change of Plasma category
The Plasma rifle is now under the correct section “Rifle” in the Auction.

Mindforce animations
Fixed some animation-lockups when using Mindforce.

Stackable items invisible fix
Corrected a rare issue with merged stackable items becoming invisible on the client.

Manufactured items with negative value
Fixed an issue with manufactured items in rare instances having a negative value.

Auction time change
The added time to an offer in the auction if it is about to expire is changed from 15 minutes to six minutes.

PK and teleporting
Fixed an issue where the PK status was not updated correctly when teleporting while in the 30 second “grace period”.

Billy Revival Terminal
Updated an issue with reviving at the Billy Spaceship Afterworld making the avatar invisible for some monsters. --

KNOWN ISSUES/MISSING FEATURES

- You can’t repair a weapon with attachments attached to it. You have to detach them prior to repairing.
- You cannot drop item onto a hangar floor.
- Currently, the virtual companies on the Exchange doesn’t offer any shares.
- Sometimes attachments may detach from a weapon when logging on.
- The Team chat is not always initiated when the Team Leader invites the first member.
- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- There are some issues with the Society terminals that will be fixed in next VU.
- Some laser carbines have the wrong graphics on the client when shown in the auction. They appear "fatter" than they should be. The looks is correct outside the auction after a logon.

List of 5.4 mini updates

System updated (5.4.0.4) [2004-01-08]

- Fixed the names in the auction for the new paints.
- Fixed an icon issue with Attachment blueprints (they all showed being level I, regardless of actual level).
- Some minor stability fixes.

System updated (5.4.0.3) [2003-12-21]

- Fixed an issue with "Corrupt Paladin arm-guards" in the loot. The correct armor will be found in the storage terminal.

System updated (5.4.0.2) [2003-12-19]

- Fixed an issue with "gluefeet" when moving on rolling terrain.
- Updated accuracy synch between server and client

System updated (5.4.0.1) [2003-12-18]

- Fixed an issue with "stickiness" when moving near walls and up ramps.
- Updated a skill experience bug with Laser Weaponry Technology, BLP Weaponry Technology, and Plasma Weaponry Technology, where the increase rate was to high above the level of 3000.

PROJECT ENTROPIA VERSION UPDATE 5.5

2004-02-17

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information

The Version Update 5.5 ("VU 5.5") for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document.

VERSION UPDATE FEATURES

New Society system
A completely new society system added. Societies are an integral part of PE structure and development in the virtual universe. Therefore a lot of energy has been put into the design and the functionality. Among the new society features included are:

- Society Themes/Template, with corresponding Society Ranks/Hierarchy within the society. This will allow for advancement, promotions and more responsibility and privileges. Gaining power within a society means you also have more rights to actively perform actions.
- Easy to use search engine, that makes searching for societies very easy.
- Diplomatic Relations, meaning you may set an official posture against another Society to show whether they are your enemies or friends.
- An intra-Society Allegiance system, for internal power struggles about the top position within the society. Make your own candidacy for being the supreme leader and fight for the members respect and their votes!
- Leaderboard High scores, which will show various prosperous societies on a high-score ranking list.
- Detailed Society Info and History, be known as the founder of a society, add required equipment, choose administration, select areas of pursuit, and much more.
- Member Roster management, an easy to use system for searching for members, add them as friends at an instant, upgrade avatar status within the Soc, or punish the bad apples immediately.

More info about the society functions is available through the help sections in the actual society system in Project Entropia.

New PvP Zone with avatar looting presented
During a deep-core drilling operation Omegaton Industries happen to release toxic fumes in the mountains south of Echidna. This resulted in an excruciating death for all human beings in the area. Mutants and robots have dismantled the mining site, but records of the event have been found in the public. These records indicate a very rich area of rare minerals, the reason Omegaton ventured out there in the first place. However, the zone is considered contaminated and normal protection levels are reduced, meaning any avatar who ventures into this zone is susceptible of looting by others. All stackable items (except ammo packs/cells, decoys, bombs/probes, and PED/PECs) are at risk when getting killed within the zone, together with any non-stackable item found in the zone. The trade terminals supply an anti-toxic shot that allows for travel within the contaminated zone. The shot is in effect until the avatar is killed in the zone. If killed outside the zone the shot still stays in effect. If

an avatar is killed in the zone he or she is instantly transported away from the zone to the last resurrection point or to Port Atlantis, if no such point exists. Even the ghosts fear the toxic area.

Participant-run shops added
Added shops to Project Entropia. An avatar may set up a shop on any estate lot he or she owns. The shopkeeper will stand vigilante 24/7 offering the goods the owner put up for sale.

New business lots in Hadesheim available
Several estate lots suitable for the participant-run shops are available in Hadesheim.

Skins usable in tailoring
Animal-specific skins can be refined into leather counter-parts. If you have good enough skill you may add animal leather to any tailoring design by putting the leather into the manufacturing interface. The Berycled coat is rumoured to be the fashion statement during the spring.

New creatures
A lot of new creatures have been spotted by explorers. Someone reported that even the infamous Araneatrox was brutally slain by these new menaces.

General creature update
Several changes has been applied to the creature on the continent Eudoria. The way they attack, their size and speed, the damage done and health level are revised. Some nasty surprises lurk in the dense Calyso underbrush. Someone even said the snablesnot seemed to have a cold…

Redesigned outposts
A new technical system added to Project Entropia, adding area-specific line of sight. This means that in some instances you will not see avatars located within buildings while you are outside of them. This includes visibility on the radar. This action enhances client performance and distributes load times.

Chat spam precautions
Some basic level chat spam prevention has been added to the main chat.

Logoff delay
A 20 second logoff delay has been introduced to counter potential misuse of the logoff functions. Even if your client loses connection to the server, your avatar will remain vulnerable during this time period.

Paint cans changes
All new paint cans come with a skill requirement. All old cans can still be used as before and are not affected by the skill requirement limit. If you add new cans to a stack of old cans, the old cans will be affected by the skill requirement.

Space ship enhancement
Take your position and be ready for launch, experience the feeling of commanding a space ship as a gunner, pilot or navigator.

Resting
Avatars may now sit or lie down, as well as placing oneself onto various chairs.

Right-click menu
You will have access to a right-click menu if you SHIFT+Right-click.

Shortcut to Friends
The keyboard key “j” is used for quick access to the Friends Interface. The Friends interface can also be moved outside of the screen, to save space.

Added functions to manufacturing

You may now add several stacks of the same material in the manufacturing interface, if you so desire.

Added Mindforce
Several Mindforce upgrades added, as well as a completely new Mindforce power. Rumours have it there are a revival Mindforce chip in existence.

Blueprint acquiring
The chance of getting a new blueprint while manufacturing is enhanced.

More weapons
New weapons added.

More armor
New armor sets added.

House decorations
Several new ways of personalizing your house is introduced.

More clothes
More festive clothing added.

More items
A news bulletin states that mutants has robbed a Toy Cargo ship…

KNOWN ISSUES/MISSING FEATURES

- You can't repair a weapon with attachments attached to it. You have to detach them prior to repairing.
- Currently, the virtual companies on the Exchange doesn't offer any shares.
- Sometimes attachments may detach from a weapon when logging on.
- The Team chat is not always initiated when the Team Leader invites the first member.
- All tailored clothes shown as "Uncolored" in the auction, even if they are colored.

PROJECT ENTROPIA VERSION UPDATE 5.6

2004-03-05

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information

The Version Update 5.6 (“VU 5.6”) for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document.

Project Entropia Gold Member Smartcard Security System

The Project Entropia Gold Member security system goes live with VU 5.6. Those who have acquired the Smartcard and Reader (through the Trade Terminal Real Life Items section) should receive the equipment during April, to the address supplied with the Project Entropia account. If you need to update the info, please do it as soon as possible through the Project Entropia Support Section.

VERSION UPDATE FEATURES

Mentor & Disciple system
We are aware of the great effort our participants put into helping newcomers to Calypso and making them feel welcome. To show our appreciation for this we have decided implemented a Mentor & Disciple system. Being a mentor is about helping newcomers get a foothold in the new universe. When you offer your help to a newcomer, and they accept, they become your disciple and you become their mentor. As a mentor you advice your disciples and support them in their advancement. When a disciple reaches certain skill levels, the disciple is deemed to be sufficiently trained to manage on her or his own.

At this point the mentor receives special surprise gifts as a reward for helping out. Some details about the Mentor system:

- A mentor “Adds disciples” by right-clicking on the potential disciple.
- To be able to act as a mentor you need to at least have reached the level "Unskilled" in any one professional standing (seen in the left section of the Avatar Info interface).
- To be eligible as a disciple you must be "Newcomer" in all of your professional standings (including Sweat Gatherer). This means as soon as a Newcomer achieves the rank of “Inept” (the rank above “Newcomer”) in any professional standing, they may not be selected as a disciple.
- When the disciple reaches certain skill levels, the Mentor reward kicks in. The Mentor has a progress rating on each disciple in his training. The actual skill levels are shown in the Disciples interface. The skill goal is quite high as the rewards are special items only acquired through this means.
- A mentor can have a maximum of 100 disciples at once. The mentor can at any time contact a disciple.
- A disciple may only have one mentor. A disciple may be a mentor for others.
- Once a link is formed between a mentor and a disciple, the disciple cannot leave it (a short "grace period" is given). A mentor may kick a disciple at any time (but why would s/he? If

the avatar has stopped participating is one reason).
- When a disciple finishes his or her training the mentor gains skill in the new "Mentor" skill (the advancement in the Mentor-skill is somewhat different from ordinary skill advancement - you will probably raise whole ranks each time you gain XP). The Mentor skill shows how many successful disciples s/he has guided.

First person view of items and actions
You now see the items your avatar is carrying in first person view. Weapons and tools are shown, as well as mindforce powers. The “Z” key toggles between FPV w/ items – FPV w/o items – 3rd PV behind – 3rd PV free.

Visual item update
Almost all weapons in Project Entropia have received a visual overhaul, and are now displayed with a much higher detail. This is a first in a series of grand visual upgrades being done to Project Entropia over the coming months.

Monster visuals update
Almost every creature in Project Entropia has been given a visual overhaul, meaning more detailed graphics with higher clarity,

New drop functions
When dropping an item from the inventory to the ground you may now determine the placement of the item in detail. This is especially useful for indoor decorations and furniture. You may even rotate items by holding down the right mouse button and move the mouse right and left, and drop some specific items on walls or in the ceiling.

New creatures
A lot of new creatures have been spotted by explorers. Someone stated a warning about being unwary in rocky terrain…

Updated robots
Several changes has been applied to the robot population of Calypso, meaning changed behaviour, damage done, and hit points. Also, the robots seems to have found new ways to spread their terror.

Logoff delay update
An “Abort” button added to the Logoff delay interface, due to community demand.

More weapons
Over 50 new weapons added.

More armor
New armor sets added.

House decorations
Someone saw indistinguishable creatures stealing rare paintings, tables, and lamps from a cargo shuttle…

Society templates
Two new society templates added based on community input – the “Mystic” and the “Basic”.

Society ranks shown
You may now view the various ranks associated with a society template.

Society Leaderboard update
Pending societies are no longer eligible for Leaderboard positions.

Increased chance of success in crafting
The chance of success is increased on lower levels of crafting.

Octagons
Several new Octagon Boxing / Training areas added all over Eudoria.

Hadesheim Marketplace update
Added a storage terminal to the Hadesheim marketplace.

Skills renamed
The skill “Ranged Critical Hit” and “Melee Critical Hit” are renamed to the more appropriate “Inflict Ranged Damage” and “Inflict Melee Damage”, as that is what the skills actually influence. No rule mechanics have changed though – the name change is a cosmetic one to avoid confusion as the term “Critical hit” can suggest a range of effects.

Avatar animation updates
Many avatar animations have been polished, among others the infamous grip on some of the BLP rifles (no more holding the rifle in you’re stomach).

Item rebalance
The infamous Improved A-3 Justifier Mk.III is rebalanced, after community feedback. The new stats are acquired by repairing the weapon.

Server upgrades
A server crash issue has been eliminated. The entire Project Entropia universe server park is upgraded with new hardware to meet the ever-increasing number of Project Entropia participants. The new system will reduce “lag” and latency issues, as well as some disconnect issues.

Client upgrades
Several fixes have been applied to the client, to reduce the rate of disconnects and Crash-to-desktop (“CTD”) issues.

Item/houses streaming optimization
The way buildings and items are streamed to your Project Entropia client has been optimized to reduce the “lag” felt when entering/exiting buildings.

Fixed issue with floors in hangars
Fixed an issue that meant you could fall through the floors in a hangar.

Fixed issue when sitting down
Fixed an issue with sitting down and becoming difficult to hit.

Fixed issue with long range gathering of items
Fixed an issue that meant you could pick up items from far away.

Fixed issue with avatar position after server crash
Fixed an issue with the avatar position not being saved when a server crashed.

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- Currently, the virtual companies on the Exchange do not offer any shares.
- You can’t repair a weapon with attachments attached to it. You have to detach them prior to repairing.
- The Team chat is not always initiated when the Team Leader invites the first member.

PROJECT ENTROPIA VERSION UPDATE 5.7

2004-06-01

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information

The Version Update 5.7 ("VU 5.7") for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document.

VERSION UPDATE FEATURES

Crystal Palace Space Station available
The Crystal Palace Space Station is opened! Take the journey into space and experience a whole new area of exploration. See never-before-seen scenery and encounters and find new items not available elsewhere. Be the first one to set foot in a unique setting, untouched by human colonists. The venture into space and the Crystal Palace Space Station is the first step of Project Entropia's upcoming exploration of space and beyond.

Project Entropia Hardware Infrastructure upgrade
The hardware platform and infrastructure handling Project Entropia is updated to new state-of-the-art equipment, capable of handling the ever-increasing number of new Project Entropia participants. Expect better performance, increased stability, and reduced latency.

New area of crafting; Armor attachments
The Project Entropia crafters has a new area to master; the creation of armor attachments. These attachments are added to existing armor pieces by dragging and dropping them onto the armor. To remove an attachment, just double-click on the armor icon while it is in your inventory.

Massive load of new clothes
A huge pile of clothes is added to Project Entropia. All these are tailorable. Some examples are:

Headwear

- Sombreros
- Fedora hats
- Bowler hats
- Top hats
- Berets

Underwear

- Bustiers
- Thongs
- Stockings
- New bra model

Footwear

- Stiletto boots
- Stiletto heels

- Cowboy boots

Other clothes

- Tuxedos
- Evening dress
- Tanktops
- Mesh tanktops
- Cut-offs
- Bomber jackets

Added colors
Several new colors have been added, including black and white paint.

New weapons
A lot of completely new weapons added, including many melee weapons.

New armor sets
Armor sets added, both craftable and lootable.

New creatures
A lot of new creatures have been spotted by explorers. Someone described a horrendous sighting on the Crystal Palace station…

House decorations
An unnamed source has stated seeing new paintings on Calypso from a renowned Earth artist.

Colorable storage boxes
Storage boxes are now colorable. It makes it easier to distinguish between boxes.

Visual item update
Several items, mainly weapons, in Project Entropia have received a visual overhaul, and are now displayed with a much higher detail. This is a part of a series of grand visual upgrades being done to Project Entropia over the coming months.

New death system
When you die you will have the option to teleport to the nearest revival point. If you decline you will be a stationary ghost, unable to move. To get the option to be moved while dead, please press the ‘T’ key on your keyboard. That will move your ghost to the nearest revival terminal. Note that the old way, where you moved to your last revive position no longer applies. One could ask oneself why anyone would like to be a stationary ghost – the answer is that you can be revived on the spot, given the right equipment or Mindforce.

’T’ key change
If you press the ‘T’ key while alive, you will be asked to confirm your decision in a YES/NO dialogue box. If you select YES you will be automatically teleported after 60 seconds to the nearest revival terminal.

Mentor system tweak
The first tweak to the mentor system makes it easier to become a disciple – you now can be Newcomer as well as Inept in your skills and still be a disciple. Expect more tweaks in future VU’s.

Teaming issue fixed
An issue when disbanding a team and then having difficulties getting loot afterwards has been fixed.

Indoor movement
The indoor movement speed is increased.

Independent Guide bundled with Project Entropia
The very nice and vibrant Project Entropia society Entropia Pioneers has, together with famed Project Entropia participant NEVERDIE created a Guide to Project Entropia, an unofficial manual of sorts for Project Entropia. The guide is bundled with Project Entropia and will available from the Project Entropia web site.

Client upgrades
New fixes have been applied to the client, to reduce disconnects and Crash-to-desktop ("CTD") issues.

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as "Uncolored" in the auction, even if they are colored.
- Currently, the virtual companies on the Exchange do not offer any shares.
- You can't repair a weapon with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 6.0

2004-08-10

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 6.0 (“VU 6.0”) for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document.

VERSION UPDATE FEATURES

New Graphics Engine implemented
After almost three years the old NetImmerse graphics engine is retired and the new GameBryo engine is in place. This new graphics engine will enable us to add a lot of really cool graphic effects to Project Entropia, like weather, shadows, dynamic lighting, etc. In the course of the next few months several such graphic upgrades will come.

Client software feedback system
If the client software happens to Crash-to-desktop (“CTD”), the client now have a feedback system in place. This system asks whether the participant is willing to help MindArk by sending in his or her current PC configuration. This information will help us track down any potential driver/hardware issues causing client stability problems.

New Avatar Trading interface
A brand new avatar to avatar trading interface added. The new interface is more secure and have a lot more feedback panels. Items can no longer be removed from the offer area without clearing the entire offer. A personal chat also appears when trade is initiated. Note: You cannot trade items that have attachments added; you have to remove attachments prior to trading, to minimize confusion.

New Map interface
The addition of new locations spawned the new map interface. A map of the Eudoria continent and the Crystal Palace Space Station is supplied, as well as a sneak peak of the newly discovered continent “Amethera” (also known as “The land grab continent”). The new map interface has various filters, a quicker navigation system, and three distinct zoom levels.

New weapons
New weapons added.

New armor sets
Armor sets added.

Longus
An issue with the Longus hit probability fixed.

Robots and lying about
Robots finally realized their prey could lie down, so the aim is adjusted accordingly.

Scrollbar added to Manufacture interface
Scrollbar added to the input material list, to allow for designs with six inputs.

Container content usable in manufacturing
You may now drag input materials directly from a container to the manufacturing interface.

Scanning issues fixed
When scanning mutant, the correct skill is increased (‘Scan Mutant’, instead of ‘Scan Animal’, even if some scientists claim the old classification should stand ,-)

Scanning oneself no more
When scanning another avatar, you no longer see your attribute levels. Now you see the target levels instead, as intended.

Skill lists
Fixed an issue when a single new skill was added and that skill was the only one on a new page, it was impossible to change to the new page.

PED Card transfer interface
Corrected the interface so it doesn’t become locked when you tried to withdraw more money from your PED card than you had on it.

Avatar interaction interface update
Fixed a potential issue with the avatar interaction menu (the one you get when you right-click on an avatar) that could cause the interface to lock up and making the avatar becoming forever “busy” until logoff.

Refiner interface
An issue corrected in the refiner interface when you added multiple stacks to it and they were auto-moved back to the inventory.

Info about blueprint books in the auction
Now it doesn’t crash when you check the info of a blueprint book that is in the auction.

Long avatar names
Limited the maximum length of the full avatar names (first+nick+last name) to 40 characters. Also updated the Friends list, estate guest list, and space ship guest list.

PED Card transactions from containers
The inventory no longer locks up if you drag and drop money from a container directly onto your PED Card in the inventory.

Mourner
Mourner now is called Mourner again.

Pixie armor
The Pixie armor is now shown correctly in the auction.

Adjusted Guardian armor
Fixed non-decaying adjusted Guardian armor bug. Increased durability on the armor.

Armor attachments
Fixed an issue with armor attachments not showing in the PvP Trade.

Repair interface and mindforce implants
Fixed issue with "Repair All" and mindforce implants in the Repair interface.

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- Currently, the virtual companies on the Exchange do not offer any shares.

- You can’t repair a weapon with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 6.1

2004-10-06

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 6.1 ("VU 6.1") for Project Entropia is a major step in the development of Project Entropia. Information about the content of the VU is located in this document. --

VERSION UPDATE FEATURES

The Amethera continent is live!
The all new continent of Amethera is released! The planet Calypso's second continent is available for exploration. The land contains never before seen creatures, threats, plants, and trees. The area of the continent is roughly three times size of the old Eudoria continent. This addition brings another great location to the Project Entropia experience, together with the Crystal Palace Space Station released earlier this year.

The first real virtual land grab!
The first real virtual land grab event will commence on the new Amethera continent! Those avatars meeting the skill requirements or who have an estate will be able to travel to Amethera and take part of the land grab. The land grab means that a society will battle for the control of a land area, on which they can set taxation on and later improve to make it better. The preliminary rules and regulations of the land grab is available here (**link:** https://www.project-entropia.com/StdContent.ajp?Id=1160)

Dynamic lights
A system for dynamic lighting implemented at indoor areas. Various light sources, like lamps or energy weapons, will now emit light. This creates a much more immersive experience.

Teaching system
A system for transferring skill levels between avatars is introduced. The system works with skill implants which functions as skill holders. The system dynamically handles how the advanced skill system in Project Entropia works, and shows the results when checking out an active skill implant.

Creature AI
The AI for the Project Entropia creatures is completely rewritten, allowing for more elaborate behaviors. In this VU we focus on the basic activities, while slowly evolving the creatures with group behavior and the like.

Speed change and synch enhancement
The general speed of movement is somewhat lowered, together with an improved synchronization. This is to allow for a more smooth experience and making the synch between client and server better. It reduces the bandwidth use, suggesting a better feel while partaking. Of course many of the creatures also have their movement rate reduced as well. Damage is lowered on some critters. Melee weapons will work better. The general experience in PvP fights is enhanced. This also creates a good foundation for the future vehicle system.

Bleaching

A new attachment for the color tool is available, allowing for the removal of colors from colored clothes. Note that it only works on clothes colored after the application of VU 6.1.

Mannequins and shopkeepers
Shopkeepers, and the new mannequins, can now be dressed and equipped. Just drag the items or clothes you wish to add to the mannequin or shopkeeper. To remove items or clothes, just drag it from them. All shopkeepers (old as well as new) and mannequins only have their undies from.

Increase of characters on lots
Depending on the size of a lot, you may now place more than one shopkeeper or mannequin to an outdoor lot.

Loot and creatures
The loot on creatures is rebalanced. The general loot balance is increased, meaning the loot will be somewhat higher after the VU. It is common that creature doesn’tcarry any loot after this update. However, when loot is found the value is often a lot higher and will include items more often than before.

Creatures removed when looting
When a creature is looted, it disappears almost instantly.

New creatures
A dozen or so new creatures have been added to Project Entropia. These will be found mainly on the Amethera continent, and they pack a mean punch. Reports of a behemoth monster has been circulating as well…

Creature rebalanced
A lot of the creatures are somewhat changed, in regards to speed, damage done, behavior, etc. Some are fiercer, while some are whimpier.

Increased stack sizes
The max number of items per item stack is increased, most notable when concerning ammo packs and PED stacks – a single ammo stack now contains a maximum of 1,000,000 shots, while a PED stack contains 10,000 PEDs. Stacks containing more than 999 units will now show the abbreviation “k” and “M” for “kilo” (a thousand), and “Mega” (a million), in the stack icon.

Ammo in Trade Terminal
Updated the max ammo stack size in the Trade Terminal to 10,000 shots per unit.

Chat activated emotes
You can now activate a number of emote gestures and action from the main chat. You activate an emote by typing “/em emotename”, where emotename can be “giggle” or “movealong”. Dances and postures are not activated this way yet.

More furniture
New pieces of furniture added, among the lot is fireplaces and candles suitable for romantic encounters.

New market places
Added more market places to Hadesheim and the Crystal Palace Space Station.

Space flight and hangar updates
Numerous issues with the hangars, space flight and ownership transfers fixed.

Sweating modified
A single creature now has a definite number of vibrant sweat available.

New weapons

New weapons added.

New armor sets
Armor sets added.

New melee weapon
The whip is added to the range of melee weapons. Some claim it can be used for something else…?

Updates to the Society function
An applicant can now see a list of the current Socs s/he has applied to. You can see land areas owned by a society. Society members get shares in the society when the society takes ownership of a land area. A member that is dismissed from a Soc in which s/he has shares is listed as "suspended", and will still receive income for as long as s/he doesn't join a new Soc. No other activities are accessible to the suspended member though. A Soc with shareholders cannot be disbanded. The society log system is updated on several counts, mostly associated with land area management. Society members are now shown on the radar.

New minerals added
Some oldies and some new ones added to Amethera.

Blood spatters removed
The blood spatters when hitting creatures is removed. This should enhance client performance. Also, in some countries, the visualization of blood is forbidden. In the future more options will be available on this matter.

New payment options added
You can now transfer money into Project Entropia using pre-paid PED certificates or using direct bank transfers. Info is available in the client, under "Transfer". The Project Entropia Transaction Center is updated with new functions.

Misc Fixes
At rare instances, the damage received when being in a yellow sulphur lake would stay on the avatar, regardless of action – even after revival. This should not happen anymore. An issue making a female avatar in sexy pose that chatted looking "bent" is now fixed. If you chose to lie down while jumping, things could get strange. This is fixed.

Spelling errors
Several spelling errors fixed. If you find more, please file a support case about it.

PROJECT ENTROPIA VERSION UPDATE 6.2

2004-11-02

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 6.2 ("VU 6.2") for Project Entropia is a major step in the development of Project Entropia. Information about the content of the version update is located in this document.

VERSION UPDATE FEATURES

Teaming updates
Teaming is massively updated. Here comes a list of features:

- A team can now consist of twelve members.
- A team is created by clicking on the Team button in the row in the main interface.
- While it is possible to have a one-man team, loot cannot be acquired under such circumstances. The team must be at least two members strong for looting to work.
- Loot distribution added. This means that when a team leader creates a team, he also chooses a set of rules that determine how team loot is distributed between the team members. Once these rules are confirmed they cannot be changed. If changes to the rules set are needed the team must be disbanded and a new team must be created. This is to ensure that once the rules are set, the team leased will not be able to change the conditions of the teaming activity without the consent of the team members. The various loot distribution rules are:

Item Distribution

- Damage Decides Order: The team member who does the most damage receives the highest valued item (if present) in the loot, the member who did the second highest damage receives the second highest valued item (if present), etc.
- Leader Takes All: The team leader always receives all items found.
- Most Damage Wins All: The team member who does the most damage receives all the items present in a loot.
- Queue: The first found item is given to the topmost team member, the next found item is given to the second member, etc, going through the roster of members. The queue position is saved every time looting occurs.
- Random: Any item present in a loot is randomly distributed to a random team member.

Money Distribution

- Damage Determines: Any PED and/or PEC found is divided among the team members, in accordance to the damage each member did.
- Equal: Any PED and/or PEC found is divided as equally as possible among all team members.

All team members can look at the rules by clicking the team button at any time. If the rules are not to your liking, we suggest you leave the team.

In the event a member disconnects from Project Entropia, he is still a part of the team for a period

of five minutes. Team members kicked from the team does not have this grace period. A disconnected team member will continue to receive loot, if he, according to the team rule set is entitled to receive any. The member will however not see any loot window or text feedback concerning this. The team member will simply find the items/PED's looted during his absence placed directly in his inventory.

A team member will receive loot regardless of distance. This even works over continents!

If the team leader quits the team, the team is automatically disbanded.

Hall of Fame updates
The Hall of Fame has been updated, with new looks and functions. Some of the new features include:

- Entries in the HoF list now show to which society an avatar belongs to at the time of the HoF-event.
- The top 25 avatars are shown instead of top 15.
- The mining section will now present the correct mineral found, instead of sometimes showing "Unknown".
- When manufacturing items, the manufactured item name is shown in the entry instead of the just the category shown prior to the update.
- The previous "PK Streak" is back, including an All time high and a 24h version. This is now called "Killing Spree".
- A loot must contain a minimum value of 50 PED to be added to the HoF list, if the value is above the current lowest entry. For Killing Spree, the minimum is ten different avatars.
- Please note that the HoF entries are not updated in absolute real time. This means the HoF list may, at rare times, appear to have different entries when two different avatars look at the list at the same time. Any such difference is updated within an hour at the most.

Share owners
All avatars owning shares from the time the Project Entropia Exchange was in operation will have their shares reimbursed at twice the purchase sum. The shares are then removed from Project Entropia. The Exchange is closed but may be reopened in a later VU.

Visuals of clothes and armor
When you drop clothes and armor on the ground, or on a shelf, they look much better than before.

Updates to visual interface styles
The overall feel in the dialogue boxes and interface is updated to a more coherent style and look.

Updated looks on armor
The Chronicle, Vain, Sentinel, and Supremacy armor, among others, have added details and looks.

Chat updates
If you type "/?" in the chat you will get help info about shortcuts. You can now send messages directly to the team (if present) by adding "/t" or "/team" before your message. The same goes for society messages, where the prefix is either "/s" or "/soc".

More furniture
New pieces of furniture added, including gothic looking stuff and shelves.

New weapons
New weapons added, especially as loot on the Amethera continent.

New armor sets
Armor sets added.

Added confirm to Mentor

Now you need to confirm the kicking of a disciple before it happens.

Server backbone updates
A lot of changes to the server system has been made, both with software and hardware. It is our continuos strive in bringing you better stability and performance.

Fixed avatar synch issues
Some issues showing avatars running on the spot and similar things updated.

Fixed an issue with Map updates
The map interface should now show all locations, including the unsafe (PvP) ones.

Fixed an issue with Society tax
You sometime couldn't see the land tax using the Society terminal (using the land area marker worked though). This is fixed.

Fixed an issue with Society attitudes
You should be able to once again change your official standing towards other societies.

Fixed an issue with death teleportation
If you pressed "No" in the interface, you no longer have to wait 60 seconds before pressing "T".

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as "Uncolored" in the auction, even if they are colored.
- If you are selling or buying an estate, make sure no activated and deployed shopkeepers and/or mannequins are present. They must be traded separately in a trade between the avatars. Else they may stop working.
- The PED Card has issues when removing PECs.
- You can't repair an item with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 6.3

2004-11-23

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 6.3 (“VU 6.3”) for Project Entropia is a big step in the development of Project Entropia. Information about the content of the version update is located in this document.

VERSION UPDATE FEATURES

Auction updates
The auction has received several updates; [list] [*]A “Last Calls” section added, where offers that are close to expiring are shown. A good place for making last minute bargains. [*]The number of items a single seller may put in the auction is changed to 15, from the old number of five. [*]Split the mineral section into subsections, and every mineral type receives a heading. So if you look for iron, you select the “Iron” section to see all iron offers. [*]Changed so that feedback messages from auction (like item sold, bids returned, etc) comes in dialogue boxes, instead of lines in the chat area. This will reduce the risk of missing vital information. [/list]

Public houses
The owner of an estate may now select to make his or her property public, using the Estate terminal. This means anyone may enter the estate, and have a look around.

Treasure Island open
The auction for Treasure Island on the Amethera continent is progressing. Now the area and buildings are opened up for public viewing and inspection. The Treasure Island is expected to be a center hub of communication, commerce, and logistics.

Loot rebalance for tougher creatures
Higher-level creatures have received a loot rebalance, meaning they carry loot more often.

New items
Various items added.

Graphics update
Some areas in Project Entropia have received enhanced graphics.

Fixed an issue with PvP trading
Carried weight now is calculated correctly on both parties involved in a PvP trade.

Fixed target boxes
Several creature target boxes have been updated to make it easier to hit and loot the creature.

Fixed issue with decayed bleaching attachment
A bleaching attachment could in some instances be used even when it was decayed to zero value. This is fixed.

Fixed creature animation
Some creatures had the wrong animations showing while walking. This is corrected.

Fixed health bar mismatch
Sometimes the health bar on a creature did not update correctly from the server to the client. This is fixed.

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- The PED Card has issues when removing PECs.
- You can’t repair an item with attachments attached to it. You have to detach them prior to repairing.
- The client shows the carried weight wrongly. It is just a visual issue, and does not affect your movement abilities.

PROJECT ENTROPIA VERSION UPDATE 7.0

2005-01-25

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 7.0 (“VU 7.0”) for Project Entropia information is located in this document.

VERSION UPDATE FEATURES

New Navigation backbone
There are several ways of performing actions in Project Entropia. An action can be anything from moving the avatar to using items.

Help screen
To get a default view of the keyboard and mouse settings, please press the ‘H’ key on your keyboard.

Aim/Cursor modes
There are two general modes in Project Entropia – Aim mode and Cursor mode. In Aim mode, moving the mouse changes the view direction. In Cursor mode, when you move the mouse, you move a cursor around on the screen. In order to click on items and buttons, you need to be in Cursor mode. To change mode, press the Spacebar key.

Options
Pressing the ‘O’ key will open up the Options interface, in which you can assign various keys for various actions. You can select other settings as well. Everyone who partakes in Project Entropia has the same default key layout.

QuickBar
The QuickBar is the main quick access interaction tool in Project Entropia. There are nine bars available, each with twelve slots. These slots are generic and you may assign a multitude of actions to them. These actions are visualized by icons. You activate an icon by either left-clicking on it, or pressing the corresponding key on your keyboard.

Each slot can be assigned an action or item:

- To assign an action to a slot, open the Action Book (default key X) and drag the action to to the slot.
- To assign an item to a slot, open the Inventory (default key I) and drag the item to to the slot (Note: only items that can be held in your hands can be used in the QuickBar).

Some examples:
Your avatar holds nothing in his or her hands. You click on a rifle icon in the QuickBar and the avatar equips the rifle. If you click the rifle icon again, you will fire the now readied rifle.

You click the run icon. Your avatar begins running straight ahead, until you influence the movement.

The nine QuickBars can be cycled using the arrows at the end on the bar. You can also access them

using the keyboard – using the F1 to F9 key. You can access each slot in a bar by using the keyboard keys beginning with 1 and the next eleven keys to the left.

Note – if you want to invert this, just click the ‘F’ icon in a QuickBar. If inverted, you cycle bars using the 1-9 keys and you access the slots using the F1 to F12 keys. Holding the cursor still over an icon in the QuickBar will show a tooltip with the name of the action or item.

Action Book
The Action Book is a collection of all available action icons you can use, from movement, item manipulation, to emotes. You can use the actions in Book directly, by clicking on the icons, but it is often easier to drag the icons you want to use to a QuickBar slot.

Inventory items
Inventory items can be dragged to a QuickBar slot. Left-clicking on an item icon will equip the item, if not already equipped – then it will be used instead. If you right-click on an item in a slot, you will receive its ‘Items Info’.

Status bars
All creatures, avatars and interactive objects in Project Entropia have a shortcut, called a Status bar. A status bar is created when you left-click and hold down, and drag, the mouse button over an eligible target. A small floating Status bar is then formed, which you can move around the screen. You can choose to interact with the target of the Status bar by clicking on it directly.

Some examples:
You have a Status bar of a Storage facility on your screen. You click on the Status bar and thus selecting it, the next click will move your avatar to the Storage facility and when in front of it opens it.

You have a Snablesnot Status bar created. You click on it with a held ranged weapon. You will automatically align yourself to the Snablesnot and fire when in range. If the weapon was a melee type, you would move towards the Snablesnot and then attack. When the Snablesnot is killed, you can loot it using the Status bar as well.

Status bars are floating and can be moved around on the screen. If you move Status bar close to one another, they will ‘snap’ together, creating larger blocks of Status bars.

Movement
Default movement in Project Entropia is through the steering keys 'Q', 'W', 'A', 'S' and 'D' and using the mouse to move the screen. As an alternative way of navigating the virtual universe, you can in cursor mode click on the terrain. The former auto-run function accessed with '3' is now replaced with a double click on a spot in the terrain and your avatar will now run there, or if you click in the sky it will run forever in that direction.

Targeting and selecting
Aiming on or holding the mouse over a creature or object will target it. A frame will be shown around the target with its name and health status. Left clicking on a targeted creature or interactive object will make it your selected target and you can now perform actions on the target. If you initiate an action but has no target selected, you will be prompted to do so. If you want to target yourself as an override (useful e g when using a Fast Aid Pack in combat) you press the ‘ALT’ keyboard key. You can also click on your name in the main interface.

Mouse scroll wheel
The mouse scroll wheel is used to zoom. If scrolled back, the camera will move behind the avatar, and scrolling forward will set the camera in the eye level of the avatar. If the avatar has a held weapon with a scope, scrolling forward from eye level will zoom the scope.

Mixed additional notes

- The default navigation setting is the old pre-VU 7.0 way. You need to access the Project Entropia Options (key 'O') to enable the updated methods of navigation.
- Running with a held item in a ready state reduces your movement speed somewhat.
- Remember that the ALT key will target yourself – useful when using Fast Aid Packs for instance.
- Right-clicking and holding down the mouse button will open up a context menu with options and actions.
- Note that you will operate a held item if you select the icon for that item, i.e. a weapon will fire.
- To unequip a held item, using the QuickBar, you need to use the 'Unequip' icon. If you are in Cursor mode and press and hold down the mouse scroll wheel, while moving your mouse, you will move the camera around

KNOWN ISSUES/MISSING FEATURES

- The Action book may disappear. It will be fixed in a patch on the 26th of Jan.
- The option settings gets reset from time to time. This will be fixed in a patch on the 26th of Jan.
- If you have an item in your hands while accessing a manufacturing machine, your avatar will disappear in your inventory. This is a visual glitch only.
- All tailored clothes shown as "Uncolored" in the auction, even if they are colored.
- The PED Card has issues when removing PECs.
- You can't repair an item with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 7.1

2005-02-15

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 7.1 ("VU 7.1") for Project Entropia information is located in this document.

VERSION UPDATE FEATURES

Mindforce updates
A new area of Mindforce has been added to Project Entropia – Resurrection.

The public Federal authority has supplied Calypso with a limited amount of portable resurrection technology in the form of Mindforce power chips. The chips are built using non-replicable robot technology reverse-engineered from robot wreck findings. The shipment of the new weapon against the robot menace was however intercepted in space by automated Devastator class strike robot ships before the security grid on the Exodus Space Station had time to kick in.

The Federal Military Cargo carrier crash-landed somewhere on the Amethera continent, and when the dispatched search and rescue force arrived, the site was already scrounged for every piece of equipment there. An initial analysis show traces of robots at the crash site, suggesting that the machines reclaimed the weapon the humans were to use against them.

This setback has initiated several courses of action. First, the chips need to be recovered, before the robots destroy or use them for their evil purposes. Second, more robot parts are needed to supply human researchers with basic materials to create more chips using this cutting edge technology. Third, the Federal Government has acknowledged the need for on-site located support, and talks about establishing a permanent research base on Calypso have been initiated.

Revival changes
When you die you use old and proven revival technology to rebuild your body around your soul essence. The revival technology is reliable with a near 100% success rate, however, it consumes vast amounts of energy and the machines are impossible to miniaturize efficiently. The revival terminals supplied by the Federal Empire are public and free to use. The instant you die, you will be given two options. Either you are teleported to a nearby revival terminal and get revived automatically. Or you stay in place. If you stay, you can wait until a Mindforcer Biotropian with resurrection capabilities are nearby. Or you can use a Personal Revival Terminal, if a friend drops one near your death location for you to operate.

Ghosts and ghost talk
The ghost as it appeared before this release is removed. A dead avatar may chat, but only those proficient in communicating with the dead will be able to make any sense out of the voice of the afterlife.

Chat system
The Project Entropia chat system is overhauled and updated. Now you will have chat access from the instant you login. This has eliminated many of the annoyances with missing chat messages, team chat issues, etc.

Friend confirmation
In order to reduce abuse and protect the integrity within the virtual universe, an avatar may now only add another avatar as friend if the target avatar confirms the action.

Amethera enhancements
The Federal Empire has begun supplying Amethera with basic facilities, after the situation is deemed "secure enough", now after the wave of colonizers have re-taken a large area of the continent.

Personalized nicknames used globally
A participant may change an entry on his or her Friends list, to a name of choice. That name will be used in every communication with the said person – in PM's, main chat, etc, for increased coherency.

PED Card update
The PED Card is now allowing for removal of PEC's without the need of having the same amount of PED's stored.

Auction updates
The auction now accepts a number of new items, including higher-level armor blueprints.

Professional standings
Sometimes the avatar's professional standing got messed up. The correct rank should now always be shown.

Auto-logoff system implemented
In order to counter meaningless idling on the servers, an avatar is logged off after ten minutes of inactivity.

HoF message fix
Sometimes a Hall of Fame chat message didn't show, this is corrected.

Better client/server creature health synch
The health bar on creatures will now update more accurately.

Manufacturing fix
Fixed an issue that could hang the client while manufacturing.

Client crash fix
A client crash issue corrected. Those participating in Project Entropia with their sound turned off should try to turn it on again, to see if they still have crash issues.

Streamlined animation
Several animations have been updated to give a more polished look.

KNOWN ISSUES/MISSING FEATURES

- Shopkeepers can become corrupted when they reach low condition. An update for this is on its way.
- All tailored clothes shown as "Uncolored" in the auction, even if they are colored.
- You can't repair an item with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 7.2

2005-03-22

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! *** General Information The Version Update 7.2 (“VU 7.2”) for Project Entropia information is located in this document.

VERSION UPDATE FEATURES

New cities built
Two cities have been built on Amethera by the Omegaton Industries and Genesis Star Interstellar conglomerates, with the blessing of the Federal Empire. Amethera is deemed to be secure enough to grant such construction, and both the Genesis Star and Omegaton representatives are pleased with the decision. The third conglomerate, Chikara OmniWorld, is expected to start construction as well in the near future. The focus and demand from the Empire is to supply housing for the colonists in the form of reasonably priced apartments.

Apartments introduced
Thousands of apartments is introduced! We want to make a place to call home available to a much larger portion of the Calypso colonists than previously possible. The apartments will be available through the auction and have the buyout price set to 250 PED for the small apartment, 350 PED for the medium and 450 PED for the large apartment. Apartments come with a maintenance fee of 10 PED per 30 days. After this time period you need to pay the fee, else you will not be granted access to the apartment, until you do. There is no limit as to the number of apartments a single avatar may own. The Beta apartments promised will be issued some time after the actual VU goes live. Thanks for your patience.

Trapping issues
The creatures of Calypso have evolved to notice when they are being “trapped”. This means that when a creature is unavailable to reach a target for different reasons, it will behave differently, and in some cases, will become immune to damage, until the creature believes it is no longer trapped.

Treasure Island lots
Ten new lots added to Treasure Island to the Lake View community.

Colors added
Paint cans added to allow for even more diversity when coloring items.

Added clothes
New pieces of clothing added, some of which are tailorable, including formal wear and shorts.

Added weapons
A great deal of weapons added, including clubs, maces, daggers, and shotguns. Some items are craftable. There are rumors about a unique item being spotted as well.

Housing decorations added
Dozens of items designed for making a home nice and comfortable have been added, including paintings, statues, and baskets.

General items added

A number of other items added to expand the range of items in Project Entropia.

Updated armor looks
Some armor sets have new and enhanced looks.

Visual enhancements
Several areas in Project Entropia, ranging from clothes, avatars, items and nature have been reviewed and updated from a visual standpoint, in order to remove oddities, like holes in clothes etc.

Amplifier feedback
Updated so an amplifier that is at condition 10% gives info to the owner about this.

Mentor loot
Added more items to the Mentor loot.

Auction accepts more
The auction now accepts more variety of items for sale.

Auctioneer back
After taking an unauthorized vacation, the auctioneers are back on Amethera.

Sweating
A slight adjustment upwards as to the number of sweat bottles acquired per successful sweat gathering has been made

Quickbar enhancements
Several minor additions and tweaks have been made to the Quickbar and Statusbar functions.

Client stability
Several potential crash issues are removed from the Project Entropia client software.

Sound system crash fixed
A bug in the sound system in Project Entropia that could cause a client crash has been removed. Participants who have disabled sound due to this problem should try to enable it again.

KNOWN ISSUES/MISSING FEATURES

- If you sit or lie down in an apartment, you may fall through the floor into the apartment below.
- Shopkeepers can become corrupted when they reach low condition. An update is on its way, tentatively scheduled for VU 7.3.
- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- You can’t repair an item with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 7.3

2005-05-04

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

General Information
The Version Update 7.3 (“VU 7.3”) for Project Entropia information is located in this document.

VERSION UPDATE FEATURES

Land Area Management
The Land Management System allows for customized land areas and creature habitats. The land areas that have this support have a Fertilizing station present, in which the owner of the land can make his or her decisions about the future of the area.

To create a well functioning local eco system, the land needs to be rich and fertile. To achieve this, Energized Fertilizer needs to be added and distributed from the fertilizer station.

The Energized Fertilizer is a unique compound made out of animal dung and growth molecules. The creature dung may be collected from the ground, while the growth molecules is a newly discovered energy matter. Adding Energized Fertilizer will give you Improvement Points (IPs) that can be used to modify the land. All changes to the land area have a cost of IPs. Also, sustaining high level creature maturity or numbers will cost IPs over time.

In order to implant various creatures, the owner needs to gather complete samples of creature DNA. Once this is acquired and processed, the creature may be added to the lands fauna. This is done by dragging the DNA sample icon to the interface. Once added, the process begins by dispatching food chain algorithms to attract the creatures to the land, and quite soon the area's eco-system is altered in the preferred way.

New Cities
Two new cities completed – Treasure Island City and Sakura City. They are located on Amethera; TIC on Treasure Island, and Sakura City to the south.

Auction Procurement Orders
You can now set a procurement order in the auction. An order is an outstanding order on items, meaning you can try to buy a bulk lot from several different sellers, at a set price, or a single item not currently on the market. You select the item type, choose a quantity you want, and a price. All current selling offers in the auction is compared to your order and those that match will be handled directly. Only full offers with a buyout value set is considered. The order will not split a selling offer if the offer is larger than the quantity the order has set, it will instead be ignored.

If your quantity isn't met, the order will stay for as long as you choose, trying to match any selling offers that comes to market.

The price to add an order is 1 PED per day you wish the order to be active. This fee is paid in advance, regardless of the actual number of days the order is active. For instance, if you have paid for having an order for five days, and the entire quantity is met within three days, the cost will still be the 5 PED’s initially paid.

Creature Maturity Levels
The various creatures in Project Entropia have received an overhaul to their titles (or maturity levels), meaning that creatures that share titles now have them corresponding correctly. Previously, an “old” creature of one kind could be maturity level 6 while another “old” creature could be of maturity level 3. This will result in some changes to how the creatures’ names and location will look like after the release, as some creatures in an areas previously occupied by, for example, “adult” creatures now have “old” creatures instead. Even though some confusion is expected, especially from the veteran participants, we are sure you will soon learn the new maturity levels, and as they are much more coherent now than before, it will be easier overall to assay creatures and their challenge rating.

Durability
All items that are worn when used have a durability rating, which shows the general level of deterioration when used. The items that have the lowest deterioration are noted as having “Exceptional” durability while the ones that are most prone to high wear and tear are noted as being “Fragile”, with a scale in between.

Treasure Island lots
Twenty new lots added to Treasure Island to the Lake View community, together with new house designs.

More Creatures Roaming the wilderness
The overall creature activity on Calypso is increased, somehow...

Music and Sounds
The Project Entropia experience is improved a great deal, with a multitude of new sound effects, ambient sounds, and music.

Jingle player
A new jingle player is added to various locations.

Updated Newcomer information
The information booths in Port Atlantis are updated with some new and more accurate information.

Focus Mindforce enhancements
The Focus Mindforce powers have been upgraded with better feedback, functionality, and security.

New Revival points
The cities on Amethera containing apartments have new Revival terminals installed.

Marketplaces in Amethera cities
The cities on Amethera have received new market places to allow for inter-participant trading.

Additions to the Toxic Zone
When an avatar kills another avatar in the Toxic Zone (“PvP3”), and the killer receives more than 50 PED in loot, a global message is shown.

Added dung
While walking around the countryside one may stumble upon animal dung, simply called Common Dung. It is claimed it can be used together with the Growth Molecules.

Added Energy matters
A new energy matter called Growth Molecules has been discovered. It can be used in conjunction with Common Dung.

Added DNA
DNA samples can be located, and can be used in the land management system.

Added Mindforce
Several high-level Mindforce powers added.

Added skills
Two new skills added; Clubs and Gauss Weaponry Technology.

Added clothes
New pieces of clothing added, some of which are tailorable, including shirts and pants. The tuxedo and dress is now tailorable.

Added weapons
A great deal of weapons added, including clubs, swords, axes, and Gauss rifles (a.k.a. “Rail Guns”). Some items are craftable. There are rumors about unique items being spotted as well.

Added armor
New armor added. There are rumors about unique items being spotted as well.

Housing decorations added
Dozens of items designed for making a home nice and comfortable have been added, including pedestals, flowers, carpets, tables and masks.

General items added
A number of other items added to expand the range of items in Project Entropia.

Visual enhancements
Several areas in Project Entropia, ranging from clothes, avatars, items and nature have been reviewed and updated from a visual standpoint, in order to remove oddities, like holes in clothes etc.

Anti-Toxic shots clarification
If you take an anti-toxic shot and you already are protected, the shot action will fail, notifying you why.

Apartment Televators
The apartment tower televators are now more predictable.

Shopkeepers
You can now remove items from a shopkeeper that is at zero condition. The visual range of the shopkeeper is greatly increased, both on radar and in main view.

Fix: Rex Top hat
Male versions may now be made.

Driver check
Project Entropia will evaluate the current graphic driver and audio codecs in use on the client computer in order to see if you have the required software installed on your computer. For more info about codecs, please see the Project Entropia Support section.

Client stability
Several potential crash issues are removed from the Project Entropia client software.

PROJECT ENTROPIA VERSION UPDATE 7.4

2005-05-24

Visual update
Project Entropia has received a general facelift in many areas. Journey around Calypso and experience the wonder for yourself.

Skill experience system update
The Project Entropia skill experience system is updated. It is now adjusted to reward a participant, experience wise, that finds challenging tasks for him- or herself. Performing mundane tasks with low risk will yield less experience. When killing a creature, a skill experience bonus may be acquired. General skill experience is received at a somewhat lesser rate, but often with bigger increase when it occurs. The relative balance is not changed however.

Property access update
The estate terminal has a button for “Restricted” and “Unrestricted” access. While set to Unrestricted, the owner may freely add and remove items or furniture from the property. When set to Restricted, the owner may not add or remove items or furniture from the property.

When you examine an estate deed, you will see the current status on the property, noted as either “Unrestricted” or “Restricted” and a date, based on MA Time (accessed through the “C” key). This is the date when the restriction was applied to the estate.

This procedure allows for safe transfers of estates with items attached. If you are on the market for an estate and see an attractive piece of property, you may look it up and see if it comes with items and furniture. If so you can be sure the items are there when you decide to buy the property, as long as you verify the restriction date on the deed being set before you investigated the estate.

Note that when you as a new owner claim your estate, you also manually need to set access to unrestricted in order to begin interaction with the property.

Buffer in the Quickbar
Added a buffer in the Quickbar system, that work when you want to change the item held by your avatar after the currently held item’s reload bar is finished.

Trapped creatures die
After a time period, a trapped creature will die.

Items info available from ground items
Using the right-click menu, you can now access the Items info viewport on items on the ground – giving you the same info as when you right-click on an item in your inventory.

Skill implant more feedback
Added info in the Items info viewport on the Skill implants, to make it extra clear to see if the implant has any skill levels added to it. If so, the line “Loaded” in visible.

Amethera LA-10 Teleporter repaired
At last, the teleporter repairman found his way to the LA-10 teleporter.

Postures added
Two new postures have been added to Project Entropia.

Shed areas added

Land areas added to Amethera, which can be acquired by a single avatar. The Shed area is complete with taxation and land management system.

More Creatures Roaming the wilderness
The overall creature activity on Calypso is increased even more, by some strange notion…

Rader ranges update
As more creatures roam around, the radar range of low-level creatures is decreased, meaning they will not show until you are closer to them. This will increase your client performance.

Music and Sounds
The Project Entropia experience is improved, with new sound effects, ambient sounds, and music.

Added clothes
New pieces of clothing added, which are tailorable, including uniform jackets and pants. The women have new sexy boots available.

Added weapons
New weapons added, including new next-generation plasma weapons.

Added armor
New armor added.

Housing decorations added
Dozens of items designed for making a home nice and comfortable have been added.

General items added
A number of other items added to expand the range of items in Project Entropia.

Visual enhancements
Several areas in Project Entropia, ranging from clothes, avatars, items and nature have been reviewed and updated from a visual standpoint, in order to remove oddities, like holes in clothes etc.

Client stability
Several potential crash issues are removed from the Project Entropia client software.

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- You can’t repair an item with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 7.5

2005-07-01

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

VERSION UPDATE FEATURES

New avatar creation process
A new avatar creation process is launched, allowing for a more streamlined experience. Everyone will have an opportunity to check it out, even old avatars.

Old avatars
If you already have made an avatar before the avatar creation update, you have a one-time opportunity to try out the new system. Please note that you at any time can press Reset, to change back to your original look in the currently selected category. When Reset is pressed all changes you have made in the chosen category is lost and your appearance will be the same as before. Note that you cannot change your gender. To continue onwards, press Accept.

Options
Through activating the icons at the top of the UI you can switch between different sections of your appearance. Thereafter you can either use the arrows in the manipulation area to select a new feature, or use the circular zone to decide the level of alteration. If you want to reset a change, you need to activate the corresponding category and then press the reset button. Furthermore, if you press one of the Preview icons on the lower end of the interface, you will get an idea about how your avatar will look in different outfits. Note that these outfits are previews only and will NOT be included in your equipment.

Controls

- Mouse: Move the cursor around.
- Mouse Wheel: Used to zoom in and out.
- Mouse Wheel Pressed down: Move the camera to various angles. Keyboard Num Pad 8: Used to move camera up. Keyboard Num Pad 2: Used to move camera down.

Confirmation
When you are satisfied with your choice of appearance you need to press the Accept button. Please note that once you have accepted your looks, you cannot do any further adjustments. However, while in Project Entropia, you will have the option to interact with a person capable of changing avatar looks, namely the body sculptor, hair stylist and the face sculptor.

Name
After you have accepted your looks, you need to choose the name of your avatar. Please choose your name sensibly. The rules and restrictions regarding choice of names are clearly stated in the Conditions of Use and any violation of these rules can lead to a permanent lockdown of your account.

New introduction
A new introduction is presented when starting Project Entropia.

New professions added
Three new beauty professions added, the body sculptor, hair stylist and the face sculptor. They can alter avatar looks, based on their skills, materials and equipment.

As a beauty designer, you can adjust the settings and changes a customer has requested. The customer will be notified when you transfer control of the process and show the suggested outcome for validation.

Your success rate ("SR") is based on your skills and the input materials chosen for the process. You can see the success rate for a 100 percent perfect outcome noted in each adjusted section. Note that more manipulation during a single procedure will lessen your overall success rate in every area.

When you are satisfied with the suggested outcome you can transfer control to the customer, by pressing Propose. The customer may accept the proposed outcome, or choose to alter the suggestion and transfer back the wishes to you for verification. You may then add new input materials to correspond with the customer's wishes.

When the customer accepts the suggested outcome, several checks are made to see the final result. Some areas, when several changes are proposed at once, may be 100 percent successful, while other have minor or no noticeable changes applied.

The general competence level of the designer influences the various areas you can alter, meaning a higher leveled designer has more options to choose from.

Added Beauty Materials
New items used by the beauty professionals have been added, including cartilage, fat and hair spray.

Added Beauty Tools
New tools added for usage when performing beauty procedures, including the hair stylist’s chair and the body sculptor’s toolkit.

New skills added
New skills added to work together with the new beauty professions.

General items added
A number of other items added to expand the range of items in Project Entropia.

Shopkeepers and Mannequins update
The Shopkeeper and Mannequin system has been reviewed and updated.

Added Revival terminals to Amethera
Based on community feedback, several new Revival terminals have been placed at various locations on Amethera.

Skill experience increased
The skill experience rate is greatly increased, based on community feedback and detailed analysis. The increase will be especially noticeable for "mid-leveled" avatars.

Fertilizing station updated
The Fertilizing station system has been reviewed and updated.

Aggression levels
Creatures roaming the lands are now less aggressive. This is especially true for lower-maturity creatures.

Creatures AI improvement
The creatures seems to have been eating smart pills and will behave more cunningly than before.

Sweating once again considered hostile

The creatures of Calypso once again consider sweating a hostile action which may trigger attacks. However, sources claim the number of sweat bottles extracted seems to have increased as well.

Updates to Options
Several new options added, including the ability to shut off wind (and thus the moving vegetation).

Change to lighting system
The dynamic lighting system slider in the options interface is changed. Now, when you move the slider all the way to the left, you have the least amount of dynamic light applied, instead of shutting it off completely.

Change to T button
When using the T button for transportation when stuck in terrain now freezes movement, to counter foul use of its functionality.

Change to blueprint
The blueprint design recipe for the Armor Plating 1A is changed, as it contained a faulty ingredient.

Music and Sounds
The Project Entropia experience is improved, with new sound effects, ambient sounds, and music.

Client stability
Several potential crash issues are removed from the Project Entropia client software.

Internal error fixed
The source of the Internal error message fixed.

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- You can’t repair an item with attachments attached to it. You have to detach them prior to repairing.
- If an existing avatar had an item in equipped when entering the avatar creation process, the item can’t be used once on Calypso. You need to re-login in order to get it usable again.
- If an existing avatar had newcomer clothes (including shoes) on, the newcomer clothes will be lost. In order to get the newcomer clothes back, you need to put all clothes in your storage facility and re-login.

PROJECT ENTROPIA VERSION UPDATE 7.6

2005-09-22

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

VERSION UPDATE FEATURES

Mining
Mining is launched by using a Detectonator tool. When the Detectonator tool is used, a bomb is automatically placed and detonated in one smooth motion. An interface is shown to see the result of the prospecting attempt. If a resource deposit is found, move within 5 meters of the site, wait for about one second and you will claim the deposit automatically. You will receive the Resource Claim deed in a loot window.

In order to extract the resources you need the correct Excavation tool, have the deed in your inventory, and aim the tool towards the Resource Claim rod.

The Claim Deed is transferable to other avatars and the owner of the deed is the one who may extract the deposit. Claim deeds cannot be put the auction, due to the time constraints. The Claim deed always shows the current resource deposit size, to avoid confusion when trading it.

The number of available bombs or survey probes is shown in the HUD area of the screen.

Even the smallest deposit will always yield at least one unit of the resource.

Drill towers
The mining drill towers are available once again. They are automatically constructed when a resource of sufficient size has been found.

Manufacturing
Manufacturing is initiated by clicking on the corresponding manufacturing machine. Select the blueprint in the correct blueprint book by clicking on it. Add the input materials specified by the blueprint. When ready, press the Manufacture button.

On the bottom-left side is the Success rate indicator. You have the highest rate of success when the bar is full and green. When red, the success rate on the selected item is low, with a scale in between. Higher blueprint Quality Rating and avatar skills will increase the success rate. The success rate indicator replaces the old "CoS" which displayed a text word feedback.

The Condition/Quality slider specifies whether the manufacturer would like to make fewer items but with a higher initial Condition (which can be important when making "Limited" items, please see the "Items with limited uses" entry) or a larger number of items with a lower individual Condition.

If you have residue of the correct kind you may add it to the input materials section in the interface. Residue will then be used in any following successful attempt in order to boost item Condition. Failure when making an item will not waste residue. The boosted item Condition does not count towards the value when determining a Hall of Fame entry.

Refining

The refiner now accepts any number of input materials. When refining, deterioration is calculated on each output item. The deterioration levels of all refiners are lowered to reflect this and are balanced towards the previous maximum output stack size per attempt, for example 50 ingots using pre-VU 7.6 refining.

Blueprints
New blueprints have been added to Project Entropia. Some of these are "Limited", please see the "Items with limited uses" entry.

Blueprint Books
The blueprint books can now be stored in Storage. The three equipment books are consolidated into one single equipment book for administrative purposes. The various book levels ("Apprentice", "Beginner", etc.) are removed; instead various "Volumes" are introduced. Blueprint books for limited blueprints are added.

Blueprint books have a searchable index page for quick access and evaluation. Book appearance will change to reflect the completeness of the book. Blueprints stored in a Blueprint book do not count towards the 200 visual items limit in the Inventory.

NOTE that any old pre-VU 7.6 Blueprint book will be automatically sold to the Trade Terminal. Your PED Card balance will be updated accordingly. This also means all your blueprints will be scattered in your inventory. If you have more than 200 blueprints and other items, you will not be able to see all of your carried items. You need to get a new blueprint book and place as many blueprints as possible therein and relog. We apologize for any inconvenience this may cause.

Navigation
Added the initial choice of choosing navigation when starting Project Entropia, between First Person and Third Person. The navigational control has been streamlined and more options have been added. You can customize your controls using the options interface, available through the "O" key.

If you had personalized your control setting prior to the VU 7.6 release you can press "Cancel" to keep these settings.

A method of movement is also suggested by pressing down both mouse buttons at once.

Tutorial system
A Tutorial system is launched in order to help newcomers find their way around in Project Entropia. The messages will explain how to navigate, how certain items work, etc, and give general pointers on what to do in Project Entropia. The tutorial messages are stored in your Tutorial messages view, available from the Action book.

The "See again" option when receiving a Tutorial message means that you will receive the same Tutorial message again in your next session in Project Entropia.

Message center
The Message center is introduced. It contains all messages you receive during your Project Entropia session. A new action for accessing the Message center is available in your Action book. Note that the messages are cleared each time you log off Project Entropia.

In later releases, the Friend messaging will be integrated into the Message center as well.

Items with limited uses
In the HUD, there is a new section which shows when you have a message waiting.

Items with limited uses
A number of new items are tagged with the (L) tag, which means they are "Limited". Limited items can only be used a certain number of times, after which the item is destroyed or removed. Limited

items cannot be repaired. Limited items can be found as hunting loot and can be manufactured.

A select number of blueprints have this tag as well, meaning you will have a limited number of attempts of making the output item.

Limited items usually have better stats than normal, unlimited items.

Learning bonus
All new items and all mining equipment have a learning bonus. This means that you need a certain minimum skill level in order to use the item to the full effect. When this minimum skill level is reached, you will receive an experience bonus that will be active until you are considered to master the item. After mastering the item your experience gain will return to normal.

Old items, excluding mining equipment, are not changed.

Skill influence damage
Weapons now shows the actual damage intervals the weapon has, based on avatar skills and mastery. Different weapons may show different intervals.

Unsafe zones changes
The nature of the unsafe zones has changed on Amethera as colonists tame the wilds. The cities, Treasure Island, and the area around the Revival terminals and Teleporters are now safe zones, where PvP killing is disabled. When you are located in any unsafe zone, the small figure icon in the HUD will be glowing.

Loot windows
The loot window functionality has changed. They are now merely a "receipt" of the items found or made. The items are instead automatically placed in your inventory when found or made. Stackable items are automatically stacked. The "Take all" button is therefore rephrased to "Close".

Statistics on items
Various items now display detailed stats when examined in the Items Info.

New advanced items in manufacturing
Three new kind of advanced item versions have been added to the manufacturing line; the adapted, the customized, and the reworked versions.

New items to manufacturing
Several new items have been added to the manufacturing system.

Display panels added
Display panels can be used to hang items, for instance your favorite weapon, on walls.

DNA added
A horde of new DNA samples has been added, and some special DNA fragments...

Wedding items
Items designed for performing wedding added.

Time left
In systems where a time limit is present, this limit is changed to show the time left until expiry. This time limit shows real time, meaning that it does not take real world incidents like Project Entropia being offline into consideration.

Condition limit change
The minimum Condition level to be able to use an item is changed from 10% to 3%, meaning an item can be used more times between repairs now than before.

Drop rule changes

Items with too low value cannot be dropped any more, in order to reduce littering.

Life state icon change
The small figure icon next to the Health bar in the HUD no longer shows whether you are alive or dead. The figure now only shows if you are in a safe or unsafe zone.

Estates to Treasure Island
Ten new estates added to Treasure Island.

Exploration
Imperial scout teams have reported that they have discovered new sites of interest. Where these sites are located is still classified awaiting further investigation.

Creature sweat levels
There are reports that the creatures of Calypso are getting sweatier...

Land Area info
When you enter or leave a land area you will receive information about this, including current tax settings.

"Empty FAPping"
The frequency of "Empty FAPping" when switching items is greatly reduced.

Fixed bugged items
Fixed a bugged melee weapon – the RepEdge Battle Axe 1x0 no longer does the strange electrical damage. The female Supremacy armor now has the correct description (same as the male version). The old text will be saved for future use. ,-)

Bug fix to Beauty items
Bugs fixed in regards to item descriptions and to the usage of the scissors.

Updated hair looks
New and more detailed hair styles added. Also, old hair styles has been updated with more detail.

General items added
A number of other items added to expand the range of items in Project Entropia.

Updates to Options
Several new options added, including navigational shortcuts.

KNOWN ISSUES/MISSING FEATURES

- All tailored clothes shown as “Uncolored” in the auction, even if they are colored.
- You can’t repair an item with attachments attached to it. You have to detach them prior to repairing.
- You cannot trade mining Claim deeds at the moment. This will be fixed shortly.

PROJECT ENTROPIA VERSION UPDATE 7.7

2005-11-01

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

VERSION UPDATE FEATURES

Furniture manufacturing
A new area of manufacturing has been added – furniture making.

Storage manufacturing
Avatars can manufacture various kinds of storage boxes.

New skills added
New skills used when manufacturing boxes and furniture have been added.

Ancient items
Old "Pre-Gold" items in existence in the Project Entropia universe at the time of version update has been permanently changed into "Ancient" items, meaning they can be used and repaired and still keep their stats.

Attachments update
All old bugged "non-decaying" attachments fixed.

Trade Terminals restocked
The weapon supply in the Trade Terminal replaced with newer and better counterparts.

Critical hits
Added the chance of scoring critical hits in Project Entropia. Both avatars and creatures have the ability and it is based on skill levels. Critical hits can result in increased damage or armor penetration (the armor does not absorb any part of the damage received).

Changes to armor system
The armor durability system updated. Now, only one durability value is shown for all kinds of damage. The armors TT value does not influence its decay rate when hit. The higher the Durability stat is, the more abuse your armor can withstand. Armor condition influences the amount of protection offered. A critical hit which penetrates your armor means your armor does not reduce the damage done in the attack at all. It will still decay though. The amount of decay is based on attack type and the amount of damage dealt. Decay only occurs when an armor can protect for the kind of damage – if a creature deals acid damage onto a armor that doesn't protect against acid, no decay is rendered.

Future advertising system trial
You may have seen the large Hall of Fame entries recently. These have in no way changed the number or the value of lower end loots. A new system is in development, which will enable us to distribute revenues generated by ingame advertising to the colonists of Calypso. To make things interesting this revenue will generate higher level HoF-entries such as the ones seen lately. Ingame advertising will be introduced within a few VU's and the testing of the addon looting system is ongoing in Project Entropia and will remain in place until the advertising system is fully

operational. Anyone who wish will have the opportunity to disable the advertising feature, this action will result in the colonist receives normal loot levels as before.

Updates to auction
The auction shows more information, as more columns has been added to the main view, including buyout price, differences between TT and current bid, etc. There is also more information available as tooltips if you hold the mouse cursor over a section or headline in the interface.

Added The Entropian to the auction
The official Project Entropia real life magazine is added to the Project Entropia auction, both as a single issue as well as a subscription choice.

New Water look
The visual style of the water in the seas, oceans and rivers is updated.

Furnishing hallways update
In some house types it were impossible to place furniture in the hallway, this is now rectified.

Robot space ship updates
More kinds of robot ships have been spotted.

Added feedback bars when dropping
When dropping an item more feedback is presented.

Quickbar Actions added
New Action icons added, to interact with the Message center and Tutorial messages.

Quickbar help enhanced
Added more information about how the Quickbar works, in the Help section of the Quickbar.

Port Atlantis upgraded
Port Atlantis has received an extensive face-lift.

New music
Plenty of new music added for various areas and situations.

Added feedback in Map interface
Added more feedback in the map section, with more detailed text and pictures.

Added more stats to items
Some items have more stats presented when looking at them in Items Info, most noticeable is the Attacks per minute stat on weapons.

Creatures has been to boot camp
The Calypso creatures have been to boot camp, meaning they now show more variance to hit probability and the amount of damage they inflict.

New client options
New Client Loader options added to the client to allow for a wider range of PC configurations.

New creatures
Scientists say new life forms have been detected on Calypso.

Focus charges protects while sweating
A Mindforce Focus now protects while sweating.

Anti-Toxic shot
An applied Anti-Toxic shot is only removed if another avatar in a contaminated area kills you.

Learning bonus

Made the feedback in the items info more detailed in regards to the Learning bonus system.

Tutorial system upgrades
More areas added to the tutorial system.

Friends list
The maximum number of Friends on the Friends list is increased, from 40 to 80.

Land Area info
A land owner may set a custom welcome message to a land area, which is shown to everyone who enters it.

Fixed bugged items
Fixed a bugged melee weapon – the whips minimum damage is adjusted to the correct level.

General items added
A number of other items added to expand the range of items in Project Entropia.

KNOWN ISSUES/MISSING FEATURES

- You can’t repair an item with attachments attached to it. You have to detach them prior to repairing.

VU 7.7.1

Date n/a

- Adjusted the deterioration levels on armor when hit
- Friends list stability update when more than 40 entries
- Mining info texts presented in the chat section once again
- Shopkeepers update
- Added info on weapons when an amplifier is attached
- The female Umbranoids have located their clothes again

Some info:
Some of the stats shown when looking on items are dynamic, meaning they reflect your avatar's skill levels. Therefore the same item may show different stats when examined by two different avatars. The ability to place mining bombs underwater is removed as the number of deposits underwater is very scarce after the release. So this is a precaution to avoid excessive bombing in a low-yield area. A section about new mining tools was missing in the content list - several new mining tools have been added to PE.

VU 7.7.2

Date n/a

- The Entropian official PE Magazine item added to PE Auction.
- Updated the coloring system to allow for visualization of more kind of items.
- Mindforce Heal chips corrected to use the right skill set ("Biotropy" instead of "First aid").
- Mindforce Firestorm chips corrected to use the right skill set ("Pyrotropy" instead of "Psychotropy").
- Mindforce Teleportation chips has received better precision in regards to were you will end up after teleporting.
- You may furnish your home with gnomes.

PROJECT ENTROPIA VERSION UPDATE 7.8

2005-11-23

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

VERSION UPDATE FEATURES

Taming
The first stage of the Taming system is introduced. It is now possible to tame certain species of the Calypso wildlife. In order to tame an animal you need to break its free spirit and subject them to your authority and leadership. This is done by using a whip. All tamable animals have three bars showing when they are targeted. These bars show the animal's level of Respect, Spirit and Health.

When health and spirit are low and respect is high enough, you may attempt to tame the animal by activating the "Tame Animal" action in the Action book.

If an animal gets hit by another weapon than a whip before the animal has been successfully tamed, it needs to regenerate to full health until you can initiate a new taming session.

Pet Feeding and Trust
When you have succeeded in taming an animal, it will be hungry and needs to be fed with Nutrio bars. You feed the pet by dragging the Nutrio bar on to the animal and dropping it. The next step is to make your pet trust you. The trust will increase when you brush it with the appropriate tool.

Pet Experience and Performance
When the pet is no longer hungry and its trust is high enough, you can try to get it to perform actions (e.g. Greet or Impress). These actions are shown in the Action book under the "Pet" tab. By performing actions, the pet will gain experience. For each level of experience the pet gains, more and more actions will become available.

Please be aware that you will need to take care of your pet and feed it on a regular basis. If you fail to keep it in the appropriate way, it will lose trust, energy and experience.

Note: In this first stage, the pet level is capped to level three. Higher levels will be added in future VU:s.

Stables
If you don't want your pet to tag along or you want to logout for a longer period, you need to leave the animal in a stable. To do this you need to find a stable keeper outside one of the cities or towns. You have to stand close to the stable keeper and then you use the stable action from the action book. When a pet is stabled you will receive a pet deed in your inventory. To collect your pet again, you need to approach any stable keeper and activate the pet deed in your Inventory.

If you fail to stable your pet in time, if no one looks after the pet (you leave it or if you are offline) for longer than 10 minutes, your pet will get automatically stabled. If this happens, your pet will lose trust, experience and energy. Please note that if the energy level and experience of your pet is 0 when you desert it, it will die!

If the pet starves while in stable it will lose trust, experience and energy.
The pet deed can be dropped on the ground or sold in private trade to other participants. It cannot be

sold in auction.

Pet Death
A tamed pet is currently not killable. This will change in upcoming VU:s.

New Skills introduced
The skill Animal lore has been added to the skill section.

New actions added to the Action Book
New actions added regarding pets and taming.

Tooltips added
The various stats when examining an item in Items Info view now have tooltips that describes the statistic to greater detail.

Auction updates
Several categories in the auction have been split into more detailed counterparts, including the energy matter elements and the skill implant sections, to allow for clearer browsing.

Limited armor updates
Limited armor and armor attachments have full protection levels until they are unusable.

Elevator repaired
The elevator in Omegaton Beta complex has been repaired. Floor nine is once again available.

More scenery
More visual objects and scenery have been added to Project Entropia.

Item count in estates
The item count is now updated correctly.

Estates to Treasure Island
New hangars added to Treasure Island.

New blueprints for tools and weapons added
Taming tools and craftable whips has been added to Project Entropia.

Fixed an issue with armor attachments
It is no longer possible to drag armor platings to the avatar in the Inventory. The platings need to be attached to the armor, before the armor is equipped to the avatar.

KNOWN ISSUES/MISSING FEATURES

- You can’t repair an item with attachments attached to it. You have to detach them prior to repairing.

PROJECT ENTROPIA VERSION UPDATE 8.0

2005-12-19

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

VERSION UPDATE FEATURES

Asteroid Space Resort
The first phase of the Asteroid Space Resort, called "Club NEVERDIE" is up. The features active in this phase are the Biodomes, Apartments, public facilities, and the main complex. Next phase will see the Nightclub, advertising system, and other areas.

New music added
A massive load of new music added to Project Entropia, including the Club NEVERDIE theme song!

Christmas is all around
The Project Entropia participants receive gifts, based on their level of commitment to the Project Entropia development.

Storage boxes
Several types of storage boxes have been added to Project Entropia, both as loot and as manufactured items.

More data in Items Info
More info shown, for instance the weapons now present their respective category.

Auction updates
Several categories in the auction have been split into more detailed counterparts, for instance gender based for armor and more sections for mining tools, to allow for clearer browsing. Also, a transport cost is added for long range auction transfers of items. Sometimes it may be cheaper to physically go to the zone the inital auction was started in.

New minerals and enmatters
Geologists have found several new kinds of minerals and enmatters on the Asteroid.

More info and feedback
Various help sections has been enhanced and more feedback is given, for instance when a disciple kicks a mentor.

New creatures
Imperial survey teams have reported on new creature sightings.

Stabling updates
Several updates done to enhance the pet stabling process.

More scenery
More visual objects and scenery have been added to Project Entropia.

PROJECT ENTROPIA VERSION UPDATE 8.1

2006-02-01

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

VERSION UPDATE FEATURES

Shops
Shop estates are now available. The Amethera cities and Club Neverdie now have dedicated shopping areas. The owner of a shop can sell items by setting a price for an item and then placing it on the wall, floor, in the display window, etc. Anyone wishing to buy an item need just click on the item and proceed through the buying process. The shops come with a display window which can be dressed as desired.

When an item is sold, a fee is also paid to the landowner (not to be confused with the shop owner) upon whose land the shop is located. The current fee is 3% on Club Neverdie and 2% on Amethera. In later VUs the fee will be dynamically set by the landowner.

A shop owner may set ‘public’ or ‘private’ access for the shop. If a shop owner elects to have his/her shop ‘private’, only people on the shop owner's guest list may purchase items from the shop.

All shops have monthly fees maintenance per month, based upon their size and location.

Item points
Estates now use an ‘Item Points’ system instead of the ‘Number of items’ which was previously displayed. This relates to the number of items you are allowed to place at a particular location in your estate. At the moment, all items use 1 Item point each, with the exception of mannequins and shopkeepers, which use 6 points each. This may result in a situation where you have already used up the maximum item points allowed for a particular location. In such case you will need to reduce the amount of items (thereby reducing the item points) in order to again be within the maximum item point limit for that location.

Market places
All market places (like those in Hadesheim) have been upgraded to "shop" status. This means you can now display items in the area. However, as before, market places do not have any maintenance fees associated with them.

Tool amplifiers
The manufacturing process has been enhanced, with the introduction of Detectonator Amplifiers. These amplifiers may be attached to the Ore or Energy Matter Detectonators, allowing for advanced prospecting. When they become available in the auction, they will be found under Tools -> Mining category.

PvP combat update
The hit probabilities for PvP combat have been updated, allowing for more accuracy and acceptance of Internet latency. This generally results in more hits in comparison to before the update. This will not affect the basic hit system involving attacker and defender skill levels.

Exit now!

When logging out of Project Entropia you may now exit immediately instead of waiting the 20 seconds stipulated by the timer. However, your Avatar will REMAIN online and can be harmed or interacted with for the full duration of the 20 seconds.

Skill progress on Blueprints
Some new blueprints now show skill progression.

New actions in the Action Book
Several new actions have been added to the Action book for quick and easy usage, including new shop activity actions.

Location face-lifts
Several locations have received visual make-overs in compliance with Imperial regulations. Fort Ithaca, for example, has been upgraded to 'town' and Fort Argus has been expanded. Other locations have been polished up as well.

New items
Dozens of new items have been added to Project Entropia in a number of various categories.

Lost CND Creatures home again
The empty dome at Club Neverdie finally have its residents.

New blueprints
Some 50 new blueprints have been added.

Avatar name
The system now remembers the chosen avatar name to display after log-off.

PROJECT ENTROPIA VERSION UPDATE 8.2

2006-03-22

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN PROJECT ENTROPIA! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING PROJECT ENTROPIA SUPPORT! ***

VERSION UPDATE FEATURES

Events
The first phase of the Event System has been introduced. Participants can now create, sell tickets for, and administer exclusive events in the Virtual Universe. PvP, hunting and vote based events may now be created for up to 100 participants.

Land Areas now also function as Event Areas when land owners activate the Public Event Area option. Event details can be accessed from the Land Claim UI. In order to register for an event on the Asteroid you must first access the correct Land Area Controller for the dome where the event will take place.

Furthermore, Event Organizer NPCs are located in special Event Areas around Calypso, such as the Fort Ithaca bar or the catwalk north of Nymphtown, allowing participants to schedule, customize and register for events in that area. Rules, Prize Items and PvP options can be customized for each event.

Reputation and Event Promoter skills have been introduced and can be influenced by all participants in an event.

Events may be thirty minutes to four hours in length with full scheduling options available through the Event Calendar.

The event chat channel has been initiated allowing Event Participants to communicate directly during an event.

Advertising
The first phase of the Ad System has also now been introduced. Participants can now create and display their own Ads in the Virtual Universe. Ad Terminals are located in all important cities and outposts on Calypso.

An Ad always has, and is restricted to, a total length of 30 seconds. Ads may consist of up to 5 Sequences. Each Sequence can have its own image and text. Full formatting options are available and every Ad can be previewed on the Preview Screen included above every Ad Terminal.

Ads are displayed throughout the Virtual Universe on the main Ad Display Boards. Ads are displayed based upon a Dynamic Display Probability. The more you invest in your Ad, the greater the probability that your Ad will be displayed. The probability will increase or decrease depending on the number and Investment value of other participant Ads. Once you've created an Ad you can later modify it and increase your investment if you wish to increase the Dynamic Display Probability.

Shops Update
A necessary change has been made to the participant shops system on the Asteroid. Participants with items displayed in the entrance corridors as well as in the display windows may now discover

that they have exceeded their maximum item points allowed for display indoors. The entrance corridors and the display windows are now together counted as indoor displays. This update should greatly increase the system performance while visiting these shopping areas.

Friends
The Friends chat has been updated and now works exactly like the Private chat. This includes a logging function which can be enabled or disabled through the main options panel. The log is saved in your Project Entropia folder. A new Friends category has been added to the Action Book and includes all the usual Friend features. These features can be accessed from the Friends List, the status bar and through interaction with other avatars. This new Friends/Private chat window has also received a make over and now allows you to ignore chat from another participant during a chat session. The Friends List also allows you to drag out an avatars status bar for easier interaction.

PvP Update
When teleporting from a PvP to non-PvP zone such as a revival terminal, the 30 second rule no longer applies. It is no longer possible to kill an avatar that has just been revived.

Port Atlantis Makeover
Port Atlantis has received a make over in order to increase system performance while visiting one of Calypso's major population centers.

Land Area Update
Land Area Owners now have the option of enabling or disabling PvP for their Land Area.

Construction Update
All the manufacturing UIs have been updated with a more sensitive 'quality vs. condition' slider allowing a greater range of setting possibilities. The success rate bar has also been updated to continually reflect your changing success status. The overall output rate however, is not affected. You will also receive a warning in the chat window if your success status is very low.

Actions Update
The Actions interface has been updated with several new icons including a participant info icon which is used in conjunction with the new Event system.

More Weapons
An assortment of new weapons has been added.

Map Update
The second Corinth Beach map location has been renamed to Treasure Island NE and relocated to its correct position.

Naked Shock
The mutants on Calypso seem to be embracing their own interpretation of flower power and are now refusing to wear clothes. As if they weren't ugly enough.

More Items
A variety of new and interesting items have been added throughout the Virtual Universe.

ENTROPIA UNIVERSE VERSION UPDATE 8.3

2006-04-24

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

New Oxford City of Culture
The Entropia Universe has now been updated with a unique city dedicated to culture and the arts. Located on the Amethera continent, New Oxford (coord. -17164, -13458) has been designed in conjunction with renowned Swedish artist Ernst Billgren.

The distinctive appearance of New Oxford is further complemented by exciting partnerships with Real World artists and clothes manufacturers. The Vexed Generation clothing brand from London have opened a store on the bottom floor of the new 'Hjorten' building where you can buy real and virtual contemporary urban clothing. Over 20 new garments are now available to participants both inside and outside the Entropia Universe.

21st Century Fine Art from New York are exhibiting over 80 works from artists such as Mark Kostabi, Marc De Muro and Kika Karadi in the fantastic new art galleries of New Oxford. Again, all pieces of art can be bought virtually for your apartment on Calypso, and some may be ordered and delivered for your home in the Real World.

As a center for the arts, New Oxford also allows participants to attend lectures from the above mentioned artists, where they reveal some of the secrets behind their success in the art world. New apartment complexes have also been included in New Oxford with many new and interesting design details incorporated. A brand new Trade Center is also included in New Oxford.

MindArk are proud to be the vanguard of interaction between the real and virtual worlds through the first virtual universe – the Entropia Universe.

UI Makeover
With the introduction of Real World item purchasing, the Item Info UI has received a makeover and now offers more options and control over the item you are viewing.

Busy Servers
As the number of Entropia Universe participants is increasing daily, participants now have the option of logging into a different server if the one they wish to log into has reached its population limit.

New Music
A range of new ambient music has been composed and implemented into the Entropia Universe.

Chat
Chat session UIs have been updated with a 'snap' feature allowing for easier organization of open interfaces.

Starting in the Entropia Universe
New avatars entering the Entropia Universe now have the option of choosing where they would like to begin: Port Atlantis or New Oxford.

Teleporter
A new teleporter has been added to Camp Caravan, east of Fort Zeus.

Furniture
A brand new range of exclusive and limited edition furniture has been added to the Entropia Universe.

Implants
The Generic Skill Implant has changed name to the Empty Skill Implant.

Limited Items
Limited Items cannot be repaired.

New Colors
The number of colors available in the Entropia Universe has been doubled.

Fixes
Several bugs have been squashed with this release including:

- The running bug that affected avatars involved in Private chat.
- A difference in action performance between the Action Book and the Quick Bar has also been repaired.
- A bug affecting updates to the beauty specialist has also been corrected.

More Items
As well as all the new clothing items that have been added by Vexed Generation, a number of other clothes, such as the tank top, have been added to the Entropia Universe by MindArk. Other items have also been added in the areas of weapons and blueprints.

ENTROPIA UNIVERSE VERSION UPDATE 8.4

2006-05-29

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

Music Streaming
Audio streaming is now provided by the owner of the Asteroid, allowing the latest sounds to be brought direct from Earth to Club Neverdie and its surrounds. The audio streaming may be enabled or disabled from the Client Loader Options and is provided at the sole discretion of the Asteroid owner.

Ad Options
An Ad option is now included in the Client Loader Options allowing participants to choose whether or not they wish to enable Entropia Universe advertisements. By enabling the ad system, participants will be granted access to larger loots.

Gold & ATM Cards
The Entropia Universe Gold Card and Entropia Universe ATM Withdrawal Card are now available and may be ordered from your local Trade Terminal. For more information, please see the news section of the Entropia Universe website.

Adjusted increase of 'Attacks per minute' for new weapons, mindforce and mining tools.
Once the minimum skill requirement for the above mentioned equipment has been met, the 'Attacks per minute' value will increase until the maximum 'Attacks per minute' value is reached. The rate of increase is related to the user's skill in operating the equipment. Furthermore, the start value for 'Hit ability' has been raised from 0.0 to 3.0, for users that have reached the minimum skill level requirement. The subsequent increase curve has been adjusted to accommodate this change. You can also now see your 'Damage' and 'Aim' skill progress status for a weapon in the Item Info interface.

Events
A new "Highest Single Loot" rule has been added to the event system. The event participant that scores the Highest Single Loot during an event will be the winner.

Private Chat
The contrast between the text and background colors of the Private Chat interface has been increased to enable easier reading.

Cannon Towers
Cannon towers have been placed close to all land area revival terminals to allow colonists a chance to recover in safety. The teleporter in Treasure Island North has also received cannon tower defense.

The Auction
Residue can now be bought and sold in the Auction from the Materials category.

More Items, Sound and Vision
Several new items have been added to the Entropia Universe, which may turn out to be quite

valuable in Calypso’s future.

New music and film composed here at MindArk have also been included.

Enhancements

- Teleporting is now a more streamlined experience again.
- All blueprints are now included within the blueprint category in the Auction.
- Tamed animals no longer go wild in the presence of decoys.
- The event system has been enhanced to more closely adhere to the set rules.

ENTROPIA UNIVERSE VERSION UPDATE 8.5

2006-07-04

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

Desktop Icons & Keyboard Mapping
The User Interface has been remodeled. The Quick Bar is now replaced with a new system allowing the creation of Desktop Icons for your favorite tools, weapons, actions and system functions. Extensive Keyboard Mapping is also available and easily organized into nine Action Sets; you can now have every situation from hunting to dancing right at your fingertips. Remember: Desktop Icons and Keyboard Maps are separate functions and must be created/mapped separately.

A Global Action Set is also available for functions you always need close at hand. Please view the updated 'Movement & Interaction' section of the Participants Guide on this website as well as the help texts included In-World by clicking the '?' symbols on the new interfaces.

Massive Advertising The Advertising System is now functional with initial advertisements from Massive now being shown. More will appear over the coming days. Enabling the Ad System in the Client Loader allows participants access to higher loots.

New Land Areas, Creatures & Resources
New land areas have been discovered on the Amethera continent, including new arctic, jungle and swamp climates, new outposts, purchasable land areas and an array of interesting items and artifacts to discover. The land areas also include several new creatures specific to the arctic and swamp climates. A number of new minerals and energy matters have also been discovered in these new areas.

Graphics & Animation
Adjustments have been made so that clothes and armor fit better on avatars. Several new hair styles have also been added. An improvement has been made to the light settings in the Entropia Universe that makes the lighting more natural.

AI
The AI of mobs has been improved in order to avoid abuse.

Action Library
Several new actions have been added to the Action Library, including the camera mode which allows height positioning of the view camera.

Construction & Blueprints
Several new components have been added for furniture construction. New furniture and weapons blueprints are also available. The success rate is displayed in the blueprint item info.

Shops
The participant shops beneath the 'Hjorten' building in New Oxford are now available for business.

Auction
The Sollomate Crusho has been moved under the Crush Weapons category miscellaneous animal

parts and natural materials have now been grouped under the materials category.

Storage Terminal in Port Atlantis
The Storage Terminal in Port Atlantis has been moved to facilitate easier access.

Terminology
A generic 'uses per minute' for all tools that employ a delay is now displayed in the Item Info.

Entropia Universe Cash Card
The Item Info text for the Entropia Universe Cash Card has been updated.

Inventory
The Inventory can now be moved around the screen.

Sweat Limit
There is no longer a skill cap for sweating.

Enhancements

- The rank order in the Active Event window now works correctly throughout an Event.
- An issue where avatars became locked when lying down with an active teleporter chip has been resolved.
- It's no longer possible to get onto the roof of the Treasure Island Bronze and Platinum buildings.
- Pets are no longer afraid to go into the stable by Fort Argus.

ENTROPIA UNIVERSE VERSION UPDATE 8.6

2006-09-18

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

New Physics Engine
As part of the ongoing enhancement of the Entropia Universe, MindArk are proud to announce the implementation of the 'PhysX' physics engine by AGEIA. The AGEIA PhysX engine delivers the computing horsepower necessary to enable true, advanced physics in the Entropia Universe.

This first implementation stage will allow MindArk to greatly enhance the Entropia Universe with exciting new features during the coming seasons.

Please note that the implementation of the PhysX engine does not require that particpants purchase the AGEIA PhysX Card. This update does however lay the foundation for extra physics features in the future which will benefit from the PhysX Card.

New Oxford
Excavations have continued under the Hjorten building in New Oxford. Archeologists and mining teams have found ancient artifacts that may suggest prehistoric inhabitants in this area. A range of new shops and boutiques have been installed in what is now known as Thorkell's Tomb. Excavations in these underground regions will continue and are sure to involve more surprises.

Creature AI
Creature AI has been boosted to now include animal herding behaviors and enhanced interactions between creatures and their surroundings.

Graphics
Avatars clothing and armor have been adjusted to reduce small glitches and missing textures.

Plastic Surgery
A number of new face types have been added to the plastic surgeon profession.

Mining
The ingredients needed for the mining amp blueprints OA-101 and MA-101, bought from the technician, have been adjusted to make the recipe slightly easier and the resulting items of a better condition.

Advertising
A range of new background images have been added for participant created advertisements.

New Items
Many new items have been added to the Entropia Universe.

New Actions
Two new actions: Rotate Left and Rotate Right, have been added to the Action Library.

Trade Terminal
Items bought from the Trade Terminals are no longer automatically stacked.

Shops
Bags and Shopkeepers can now be repaired without having to empty their contents.

Team
The Team Interface can now be moved.

Teleporters
The teleporter list no longer opens automatically when you walk onto the teleporter. Simply click the operate action when on the teleporter to activate the list now.

Hangars
The door between the control room and the space ship hangar now opens automatically.

Old HUD Icons
Old HUD Icons have been removed from the Cybernetics and Small Items categories of the Inventory.

Stables
Stables that were to close to Fort Argus and Fort Zeus have been moved to reduce animals fear at being stabled.

Other Enhancements:

- The PvP zone has been removed from around New Oxford.
- Distracting messages, received by pressing movement keys while using certain terminals or viewing items info, have been corrected.
- The difficult stairs up to NeverDies VIP bar on the asteroid have been fixed.
- The Options Icon has been changed.
- An auctioneer has been placed in the Shinook Jungle outpost.
- The cannon towers have been upgraded with a new design.
- The jukebox in Fort Fury is working properly again.

ENTROPIA UNIVERSE VERSION UPDATE 8.7

2006-11-01

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

Auction
The public auction has been improved. Enhancements include:

- The number of items that can be placed on the auction has been increased to 30.
- The auction fee has been modified to a base fee of 0.5 PED plus a regressive markup commission beginning at 5%. Please view the updated Auction section of the Participants Guide for more detailed information.
- For limited and stackable items, the Buyout column now displays the Buyout price as a percentage of the TT value, with the actual PED amount transferred to the tool tip. For unlimited items the Buyout column will display the markup value in PED, with the total Buyout price in the tooltip.
- Auction categories have been updated. MindForce and Residues now contain sub-categories. Weapons have been divided into BLP/Plasma/Laser/Gauss and even a Cannon category. Weapon Amplifiers have been divided into BLP and energy categories. Mining Amplifiers have also been divided up. New categories have been included for new items

Participant Owned Shops
The tax paid to landowners has been reduced from 5% to 2.5% of the item markup value to coincide with the auction adjustments.

New HUD Design
The main HUD (Heads-Up Display) has been redesigned. Increased transparency and more chat filters have been included. The upper row of color coded buttons control which channels you wish to read. The lower row of buttons control which channel you wish to write to. Don't forget, if you want to write to a channel, you should also enable reading of the channel.

The tool section of the HUD now automatically disappears when no tool is equipped. Teleporters are now displayed on the radar as light blue. Auctioneers, event organizers and other friendly trader NPC's have changed color in the radar from light blue to orange.

Options Interface
A new option has been included in the Options Interface called 'Align radar with camera'. When enabled, this option allows the radar to follow the camera's orientation. Otherwise the radar follows your avatars orientation. Tooltips have been included for the first and third person options in the Options Interface.

Weapon Amplifiers
A range of new limited crafted and ready-made amplifiers have been introduced. New resources and items necessary for their construction are also in place. With this new range arriving on Calypso, compatibility requirements now require that the correct weapon is matched with the correct amplifier in order to the achieve the maximum 50% power boost available from an amplifier.

Regardless of compatibility, amplifiers can still be attached to weapons and will continue to deteriorate and consume ammunition. For more information about this change, read the Preview VU 8.7.

New Mining Amplifiers
New 'Light' versions of low level mining amplifiers have been introduced in response to participant feedback regarding high manufacture costs. The 'Light' version amplifiers have a lower TT value and are cheaper to manufacture.

The OreAmp OA-101 and EnMatAmp MA-101 blueprints sold by the technician have been replaced with the OreAmp OA-101 Light and the EnMatAmp MA-101 Light. The manufacture cost of the OreAmp OA-101 blueprint, previously sold by the technician, has also been slightly reduced.

Skill Implants
Skill Implants have been revised. In order to facilitate the transfer of considerably larger amounts of skills, new Empty Skill Implants can now be found with TT values up to 1,250 PED, the TT value being a measure of how much skill the implant can contain.

Should you only partially fill an Empty Skill Implant, you will receive the remainder in a new Empty Skill Implant with the remaining value. If the remainder has a value below 10 PED you will receive PED directly. In accordance with these changes, existing Empty Skill Implants now have a TT value of 12.5 PED and the TT value of existing

Filled Skill Implants has been multiplied by 10. Empty skill specific implants are no longer available and existing implants have been replaced with Empty Skill Implants which can be used for any skill.

Graphics
The light setting adjustments begun in VU 8.5 have continued with new shading for avatars and creatures. Fog and sunlight settings have also been adjusted to add more variation to the landscapes on Calypso. Improved water and sky textures have also been added. New options have been included in the Options panel of the Login Window to customize settings. Further details can be read in the updated Start, Login & Connection section of the Participants Guide.

Other graphical improvements include:

- New target box graphics.
- The size of icons in the Inventory has been reduced.
- The Interaction Menu and Action Library categories have been color coded.
- Several Action Icons have been redesigned to better reflect their category.
- The first person death effect has been improved.
- New effect animations have been implemented to more clearly display dung and fruits.
- Improvements to the contrast and color settings of the Amethera map.

Updated System Requirements
In order to provide a better service to participants, the system requirements for the Entropia Universe have been revised and divided into three categories: minimum, recommended and optimal. Please read the updated categories in the Start, Login & Connection FAQ for further details.

Terminals
Terminals like the trade and construction terminals found on estates can now be used by all visitors.

New Items
Version Update 8.7 includes the largest introduction of exciting new items for quite some time. Enjoy.

New Music

New global music has been included for your adventures on Calypso. Expanding on the current theme of acoustic elements like piano, guitar, and ethnic percussion, the new symphonic instrumentations are typically Entropian with plenty of exciting new loops and samples from near and far. Turn it up!

Treasure Island
New houses have been built on Treasure Island. In Treasure Island City, the Trade Center has been moved closer to the teleporter and extra cannon towers have been constructed.

Beauty
Over 10 new hairstyles have been added to the Hair Stylist profession.

Other Enhancements

- Numerous minor bug fixes have been applied.
- Small erroneous PvP pockets that existed in and around New Oxford have been cleared up.
- NPC's in the Ithaca Bar, Nate Valley and Twin Peaks are completely above ground again.
- Several BLP weapons that spent laser cell ammunition have been corrected.
- When you have been outbidden for an item on the auction, your bid amount is transferred back to your account immediately.
- The sunken bridge north west of Atlas Haven has been repaired.

Version Update 8.7.1:

2006-11-02

- The missing 'No Loot' message has been restored.
- The incorrect values displayed in the Item Info for weapons and armor attachment combinations have been fixed.

Version Update 8.7.2:

2006-11-08

- The Entropia Universe can now run in windowed mode. Check the updated Options panel in the Login Window for additional settings.
- Several teleporters which had sunk underground have been restored. The immediate area around teleporters have been fixed to look more natural again.
- A graphics bug when using telescopic sights has been fixed.
- Shop keepers are again displayed on the radar.
- New Items have been added to the Entropia Universe.

Version Update 8.7.3:

2006-11-15

- Several small issues with Windowed Mode have been cleared up.
- The chat filters that reacted rather slowly have been revised to perform the *filtering action quicker.
- Ammunition has been added to creature loot.

Version Update 8.7.4:

2006-11-16

- An issue regarding the auto-stacking of looted ammo has been resolved.

ENTROPIA UNIVERSE VERSION UPDATE 8.8

2007-01-17

Content Listing VU 8.8 Not Available.

Version Update 8.8.1:

06-12-20

Some problems we were able to address quickly due to well documented feedback from the community.

- A bug in the auction system causing the 'My Bids' section to display double entries has been fixed.
- Avatars that began sliding while writing to chat during auto run have been fixed.
- Turned off lamps that lit up rooms upon loading are repaired.

We are also aware that certain participants are experiencing 'rubberbanding'. We are continuing to work on this.

Version Update 8.8.2:

06-01-17

- Delayed sound effects with certain weapons have been fixed.
- Bird sounds when logging in indoors have been corrected.
- Skill level gains have a new sound effect.
- Estate terminals that could display incorrect estate information have been fixed.
- Creature AI has been optimized.
- Continued optimization of the physics system.

ENTROPIA UNIVERSE VERSION UPDATE 8.9

2007-02-06

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! *** VERSION UPDATE FEATURES

Participant Content (PC)
Images and video can now be uploaded and displayed on Signs, Screens and Displays with (PC) after their name e.g. Xlite-S Sign (PC).

This first stage of Participant Content will add a new dimension to communication, advertising and social entertainment in the Entropia Universe. Invite your friends from around the world into the comfort of your apartment or house in the Entropia Universe to view your own videos and pictures. Why not produce artwork that can be sold in shops or at the auction? The possibilities are limitless.

A new PARTICIPANT CONTENT Icon has been added to the ACTION LIBRARY. For further information about fees, accepted formats and more, see the updated Advertising Guide.

Banking Licenses
Five exclusive banking licenses are now available for bidding at the public auction on Calypso. For complete details about the licenses, please read the Banking Licenses Info.

Shopping Malls
All shopping malls now have televators on each floor.

Shopkeepers
Retail price information (markup +TT, or % for stackables and limited items) is now included for items sold through a Shopkeeper.

- The fee for making an item available through a Shopkeeper by setting its price has been removed. Deterioration of Shopkeepers when items are sold has been reduced considerably.
- A 2.5% regressive markup tax has been introduced for all sales made through all Shopkeepers in the Entropia Universe. This tax is paid to the landowner.
- The existing fixed tax of 2.5% paid by shop owners to landowners has also been made regressive.
- Just like the auction, the regressive tax on the markup makes sure that as the markup value increases, the tax percentage decreases, ensuring that the total tax will never exceed 50 PED.

Auction
Extra information (markup +TT, or % for stackables) added to auction messages when an auction has been won, when a bid has been surpassed and when an item has expired without being sold.

Graphics
Several new outposts have been created on Eudoria. Continued improvement to avatar body parts including fingernails for female avatars and better definition in the head, neck and shoulders area.

Lighting & Shading
Improvements have continued with the introduction of light and shading effects indoors. Things are looking better than ever.

Action Book

Continued color coding of ACTION LIBRARY categories plus new icon designs.

Team Rule
Due to exploits in PvP combat, the 'Leader takes All' rule has been replaced with Looter takes All - the team member that loots a creature first always receives all items found. When looting another participant, the loot is given to the team member that inflicted the most damage.

Loot Distribution
We have adjusted how often low to mid-range creatures carry loot. However, as the loot size depends on how often the creatures carry loot, the overall loot has not changed.

New Items
New weapons shipments have arrived on Calypso. Volume II of the equipment blueprint has been added to the Technician.

Condition Limit
A Condition Limit has been introduced for items. The Condition Limit, now included in the Item Info panel, is the lowest possible condition an item can have and still be operated.

Music & Sound

- The inclusion of 10 new tracks brings the Entropia Universe play list to over 100 original soundtracks for your adventures on Calypso.
- Different sounds have been added for the different refiners.

Other Enhancements

- A Gold Card advertisement has been included In-World in the first in a series of account security awareness campaigns.
- Old 'Project Entropia' signs removed from the new arrivals landing area in Port Atlantis.
- Sitting avatars that could run around have been corrected.
- The Default button in the Options panel now resets all settings to default, including the sound, music and gamma sliders.
- New canon towers added at Omegaton West Habitat.
- Numerous graphics bug fixes.
- Incorrect pet animations have been fixed.
- Laser sights and scopes can no longer be attached to MindForce chips.
- Several furniture items that could not be interacted with correctly have been fixed.
- Coloring system problems fixed.
- Footstep sounds when moving forward have been fixed and their volume adjusted.

Version Update 8.9.1

2007-02-08

- Adjustments to Participant Content system.
- A bug causing avatars to get stuck in stools has been fixed.
- Team rule 'Looter takes All' working properly.

Version Update 8.9.2

2007-02-13

- Space flight is now working correctly again.
- The different weapon effect colors have been restored.

ENTROPIA UNIVERSE VERSION UPDATE 8.11

2007-03-20

VERSION UPDATE FEATURES

Akmuul Island
A whole new island has been opened up for PvP combat excitement in southern Amethera. Akmuul Island holds a few surprises for everybody, with new areas and settlements to explore, undiscovered native inhabitants, undiscovered raw materials and even two new land areas available for sale.

PvP combat has also been enhanced to make better use of a participant's accuracy.

Market Value
The Market Value history of items is now available to all in the Entropia Universe. When opening an Item Info panel, a new Market Value icon, in the lower right corner, allows any participant to see the value history of an item based on data taken directly from the official Entropia Universe Auction. The new icon has also been added to the Action Library.

This free service will allow participants to examine both detailed and average trends at daily, weekly, monthly, yearly and even decade intervals. More information is available in the updated Auction Guide.

Resolution
The Entropia Universe can now run on higher resolutions depending on your Graphics Card and Monitor capabilities. You can select desired resolution for Windowed and Full Screen modes in the Login Window Options dialog. Please see the updated Start, Login & Connection Guide.

Participant Content
A new property has been added to Participant Content capable items, displaying the name of the avatar that last modified the content. This will help in verifying the authenticity of art works exchanging hands within the Entropia Universe.

Graphics

Light & Shading
Light and shading improvements continue with shading of the avatar in the inventory view, item shading in the item info view, and the introduction of bump, specular and reflection textures on ingots, precious stones, Atrox and a robot model to begin with.

Numerous other small graphical improvements have also been made including:

- General graphical improvement of Icons like having their corners rounded and a little shading added.
- Adjustments have been made to the close and help icons of the Keyboard Mapping system and the small buttons on the HUD.
- Several ingots have received new appearances to increase variation.
- Palms Corner has received some attention: The Shop Container and storage terminals now

work. The rock on top of the teleporter has been relocated and some flickering textures have been fixed.
- A number of lamps have been adjusted as they were not giving enough light. Fireplace light has also been adjusted to give a warmer glow.

New Items
A range of new items have been added including a new TT Medical Kit and new TT Mining Tools. Other new items in areas like combat and manufacturing have also been included.

Basic Properties
Items now have their basic properties (M, F, L, C, D and PC) included in their Inventory view.

Sound
New outposts and new equipment have new sounds.

Other Enhancements

- The Split Item interface has been redone.
- Manual rotation of Items is now available in the Item Info View Controls. Disable auto-rotation first and use the mouse wheel to zoom in/out and rotate in any direction.
- The PvP anomaly inside the Trade Center at Rei's Defense has been cleared up.
- The revival terminal has been moved closer to the Gun turret at Nea’s Place.

ENTROPIA UNIVERSE VERSION UPDATE 8.12

2007-06-04

Content Listing VU 8.12 Not Available.

Version Update 8.12.1:

07-06-05

- Crashes during repair fixed.
- Item info now opens in front of the Trade Terminal window again.
- The zooming with scopes corrected.
- Best possible result preview for coloring changed.
- Adjustments have been made to resolve some connection issues.

Version Update 8.12.2:

07-06-07

- Scanning an avatar that has an equipped mindforce chip is now safe.
- The oil rig extracts oil again.

ENTROPIA UNIVERSE VERSION UPDATE 9.0

2007-10-09

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

Avatar Creation
Avatars, armors and clothes have been remodeled. Improvements include:

- Increased polygon count.
- Higher resolution texture maps.
- Normal mapping technology.
- Reflective and glossy surfaces.
- Dynamic level of detail technology (see below).
- Advanced shader usage allowing realistic combinations of different clothing materials.
- Existing avatars will now have the opportunity to remodel their avatars. Please take your time during the remodeling process as the procedure cannot be changed once 'Accepted'. A tip in achieving a unique appearance is to begin by randomizing the basic avatar before going into detail.
- Facial expressions will be introduced in a later Version Update.
- Beauty Specialists have access to a greater range of avatar modifications than the initial Avatar Creation process.

Bank buildings and functionality have now been introduced to Port Atlantis, Twin Peaks, New Oxford and Fort Argus. The fifth bank will be introduced shortly when its design has been completed. Bank owners will configure their services over the coming days.

Inventory
The Inventory has been redesigned. Increased functionality includes:

- Categories have been reorganized and new categories introduced.
- A new "View Equipped/All" toggle button allows you to quickly view which Inventory items your avatar has equipped.
- A new "Compact" button allows you to automatically reorganize your Inventory making the most efficient use of available space.
- A new "Avatar Camera Focus" button allows you to instantly bring your avatar into In-World camera focus.
- It is now possible to Equip/Unequip by directly dragging items to/from your In-World avatar.
- The inventory "Avatar View" section has been separated and is display optional.
- Equipped Items are highlighted in blue in your Inventory "All" view.
- Quick Menu functionality has been introduced for all Inventory objects allowing you to right click on items in your inventory and quickly view "Avatar Info", "Market Value", or "Equip/Unequip", "Split", "Open", "Detach Attachments", and "Merge All" for similar stacks.
- Items entering the Inventory are automatically sorted to the correct category.

Trade Terminal
The Trade Terminal interface has been redesigned. Improvements include:

- "Buy" and "Sell" are now two separate transactions.
- Unique amounts of ammunition/bombs/probes can be instantly bought, for example 87 probes or 3049 Medium Weapon Cells.
- A "Confirm Transaction" panel has been introduced listing all items being sold to the Trade Terminal. Items mistakenly sold to the Trade Terminal will no longer be replaced by the Support Dept.

Repair Terminal
The Repair Terminal interface has been redesigned. Also:

- A "Confirm Transaction" panel has been introduced.
- The default repair setting is now 100%. Use the slider to change repair percentage.
- It is now possible to repair equipped MindForce implants using the "Add Equipped" function.
- Equipment with attachments can now be repaired without having to separate the different pieces.

Storage Terminal
The Storage Terminal interface has been redesigned to reflect the same layout as the new Inventory including automatic item sorting (as Inventory) and the "Compact" button function (as Inventory).

Action Library
The 'Friend' section of the Action Library is renamed 'Avatar' and has received several actions previously founding the 'Interaction' section, including Avatar Info, Society and Team actions.

Coloring
The coloring system has been enhanced. Improvements include:

- Paint Cans have been redesigned and new colors introduced.
- A saturation slider has been introduced to the coloring process to allow better control over the final color.
- Lower skilled participants may attempt difficult colors but with lower success rate. A warning message is displayed when attempting to use colors above recommended skill level.
- 'Success Rate' and 'Professional Requirement' information for all colors has been added in the Item Info panel.
- Coloring using Paint Cans with difficulty matching your skills will give a learning period skill increase bonus.
- The success rate has been revised to better reflect skill level and amount of paint cans used.
- The amount of paint used when coloring will affect coloring results.
- Most of the Paint Can value is now transferred to the colored item.
- Items no longer deteriorate when colored.

Participants with Paint Cans in their inventory may notice that their amounts have changed. No loss of value has been incurred as the system was rebalanced to provide the same output from fewer cans.

The words "Uncolored" and specific leather type names have been removed from Item names. The information can be found in the Item Info stats instead.

Armor/Clothing

- Armor Foot Guards are finally introduced. No extra damage will be incurred by avatars without Foot Guards until Version Update 9.1.

- The increased detail of armor and clothing will demand more system performance. In an attempt to stave off a lag increase, a deterioration of 2 PEC per item has been introduced when equipping garments and armor. Increased realism will make clothes look more worn as their condition diminishes.
- Just like today, all combinations of different armors and clothes will not be perfect but many new unforeseen combinations will look great.

Dynamic Level of Detail
A new 'Avatar Quality' slider has been included in the In-World Options panel allowing participants to increase or decrease the quality of avatars in their vicinity. A higher value allows better quality textures but increases memory consumption on the video card. A reduced value allows more avatars to be in view without increasing lag.

Navigation
Following feedback from the Entropia Guides, default navigation has also been mapped to the arrow keys on the keyboard. Your avatar can be rotated by right clicking, holding and moving the mouse. Unfortunately this was not compatible with the 'Instant Action Menu' option and it has therefore been removed from the In-World Options panel.

Beauty Styling
Only the basic range of hairstyles is available in this Version Update. A complete range of extra hairstyles will be added in Version Update 9.1.

Items
A wide range of new items have been introduced. In the near future we will increase participant customization of various items including clothes, furniture, storage boxes and more. Participants will be able to apply different materials like metal, wood, leather and latex to customizable items. Due to the ongoing development process of this feature, crafting with leather has been disabled.

Login Window Options
"Disable Shaders", "Lower Resolution Icons", "Low Resolution Avatar Texture", and "Reduced Visual Effects" options have been removed from the Login Window Options panel.

Entropia Universe Web Site
The Account Application Process has been optimized.

Support
Support Dept. services have now been extended to Saturdays.

Other Enhancements

- The "Equipment" category in the Auction has been renamed "Components".
- An Extract PED/PEC function has been added to the PED Card Item Info panel.
- The "Attitude" feature, which allows society members of Rank 1 to set a relationship attitude to other approved societies, has been fixed.
- Also, the Umbranoid species have disappeared from Calypso for the time being.

Version Update 9.0.1

2007-10-11

- The 'Add All' function in the Repair Terminal no longer destroys items Key Mappings and Desktop Icons.
- The Techtonic (F) jacket no longer causes torsos to disappear.
- Grassy Slacks (F) are fully visible again.
- Dodge skills are now included in fighting creatures with long range attack abilities.

- Shop owners can again pick up items in display areas.
- Item Info is again visible in private trade.

Version Update 9.0.2

2007-10-16

- The 2 PEC deterioration of Limited armor pieces when equipping has been removed.
- The deterioration of Unlimited armor pieces has been reduced to 1 PEC per equip.
- An option is now available to change between aim and cursor mode by pressing the middle mouse button. The existing function of changing camera direction with the middle mouse button is now available as a configurable Action.
- Stability fixes have been introduced to reduce client crashes.
- Light settings have been adjusted in Avatar Creation.
- The 'lying down' animation has been corrected.
- Several objects missing textuers have been corrected.
- Numerous clothing graphical fixes including droplet skirts, coats and more.
- Weapon sounds fixed.
- Feedback messages when trying to color 'uncolorable' items. Also when bleaching has been successful.
- Terrain fixes in New Oxford and Omegaton City.
- The Spiral Street Night Shift Jacket (m) and (f) have the correct colors
- The weight of paint cans has been adjusted.

Version Update 9.0.3

2007-10-23

- Slight adjustment made to extreme avatar body sizes. All avatars are adjusted towards average size. In comparison to VU 9.0, the tallest possible avatar will be app. 10 cm smaller and the smallest possible avatar will be app. 10 cm taller.
- Stability fixes have been introduced to reduce client and server crashes.
- Numerous clothing graphical fixes and colors matching/adjustments made, including Renegade Fashion Maze-series, Luna Line Solar-series, Urban Nomad Scarlet coat, Spiral Street Night Shift jacket, Omegaton Jungle Walkers, Renegade Citadel Fashion-series, Urban Nomad Grassy shirt, Luna Line Pulsar pants, Urban Nomad Blue briefs, Storm jeans, Pleat Coat, Lina Line Corona shirt, Droplet skirt, White jumper, and more.
- Creatures killed will stay unmoving.
- Added message window when equipping clothes/armor that remove a previous worn piece.
- Basic Relays can once again be seen.
- Some unauthorized wall building in Fort Ithaca has been removed.
- A gun turret has been added to the Revival terminal by LA 39.
- The bar in Fort Ithaca is once again firmly attached to the ground.
- Moving avatars has a more stable walk and run stance.
- After a short stint of sales, the TT once again sell the Castorian Combat EnBlade-1 instead of the EnBlade-A.
- The auction no longer shows the same message three times when selling boxes with items.
- You can now dismiss a newly tamed animal.
- The Buy and Sell buttons exchanged in Trade terminal
- Changed popup warning message when Inventory reaches 200 items to a mailbox warning message instead.

ENTROPIA UNIVERSE VERSION UPDATE 9.1

2007-12-11

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

Beauty
A range of cosmetic products including foundation, eyeliner, eye shadow, cosmetic pens, lipstick, rouge, powder, face paint and more have been added to the Beauty System. The new Make Up system allows avatars to customize special make up masks for themselves and others. Please read the new Beauty section of the Participants Guide for further details.

This new system is not connected to avatar skills and is a trial in basing a system on participant's real world skills.

A new 'Beauty' section has been included in the Action Library containing all the necessary actions for the make up procedure.

Forty new hairstyles have been introduced to the beauty system.

Tailoring
The tailoring system has been enhanced with the addition of Material Texture customization options. All existing colorable items are now customizable, meaning participants can apply and remove custom colors and material textures.

Using new blueprints and extractors, Material Textures can now be manufactured from a range of well known minerals, precious stones and more. Using a new Texturizer tool, the Material Textures can then be applied to the various fields of customizable clothing. A range of further items including furniture will also be customizable in the near future.

The Colorator tool and Bleacher Attachment have received a visual update.
For further instructions on how to apply unique Material Textures to clothes, please read the new Tailoring section of the Participants Guide.

Entropia Universe Login
In order to further increase account security, Login and Password entry fields have been moved from the Login Window to the Entropia Universe Client. Launching the Entropia Universe Client is still carried out from the Login Window.

Armor

Armor Foot Guards
A new body armor part has been added. Armor foot guards are now included in hit location calculations. Accordingly, the hit rate on the different body armor parts has been adjusted.

Limited Armor Sets
A large range of new limited versions of previous existing armor sets have been introduced. All limited armors and limited armor platings, old and new, have received a 10000 point increase in durability to give them a competitive edge.

Armor Deterioration Adjustment
As before, absorbing massive damage in a single hit decays armor more than when absorbing equivalent damage over several minor hits. This difference in armor decay between the massive single attack and the multiple minor attacks has been reduced, meaning the massive single attack will decay armor slightly less and the multiple minor attacks will decay armor slightly more. This is an effort to make attack effects fairer. The overall deterioration level remains the same.

Avatar Skills

- The Avatar Info panel has been removed. Skill details can now be found in the new Avatar Skills panel (automatically mapped to the original Avatar Info key).
- An 'All Categories' option has also been included which now contains Promoter Rating and Reputation skills.
- The previous system of rank grade rating e.g. Capable (Grade 1), Competent (Grade 2) etc. has been replaced by a graphical representation of rank progression.
- Sorting options are available for Skill Name, Rank and Points by clicking column titles. Market History value information is also available when extracting skill points.
- The Avatar Skills panel also saves your last view when you close the panel, presenting it again the next time you open the Avatar Skills panel during the same session. The panel is reset when you log out.
- Mentor and Disciples info can now be viewed using the Mentor & Disciples action from the System section of the Action Library.
- Choice in avatar name display has been removed. All avatar full names are now displayed.
- The 'Make Cloth' skill has been renamed to 'Make Textile'.

Key Mapping
When dropping an action or item icon on an existing desktop icon, an option will be offered to automatically map the new item/action to the key that was mapped to the previous existing item/action.

Hangars
Spacecraft are no longer locked to their home hangars. Spacecraft can now travel to any hangar the spacecraft owner may own. In order to be able to operate a spaceship, the hangar needs to be unrestricted.

Hall Of Fame
All Hall Of Fame lists now include the top 100 entries.

Clothing

- Graphical issues with the Leather Duster Coat have been fixed.
- Adjustments to Pleat Coat (M) to remove holes on the back.
- Holes in the Tank Top have been removed.
- Luna Line Pulsar Pants now have the right pattern and color.
- The droplet skirt can now be removed by dragging it to the inventory as with other clothes.
- Thrill Seeker Actions Shorts colors have been fixed.
- Urban Pattern Shirt (F,C) color fields corrected.

Condition Limit
The condition limit indicator now displays the usable condition range e.g. the top 10% condition for items with a 90% condition limit.

Calypso Buildings
The fifth and final bank has been introduced to Atlas Haven. Also, a Chinese CRD (Cyber Recreational Development Corp.) building has been introduced to New Oxford.

Chat
A new dedicated local chat channel for trade has been introduced. Participants are requested to use this channel for repeated trade announcements.

Land Management
As changes in land management can only be made once every 24 hours, the 'Ok' button in the Land Management panel is disabled during this period. Improvement Points are no longer drawn while the server is down.

Items, Actions, Professions & Skills
A large number of new items, actions, professions and skills have been added to support new systems introduced to the Entropia Universe. A number of surprises are also to be discovered.

Music
New tracks have been included for your adventures on Calypso, including several specially written PvP tracks.

Entropia Universe Website
The 'My Items' section of the website now displays all items in their correct ?Container? e.g. Carried, World, Stored, Estate, Shopkeeper, Auction etc. Increased PayNova 3.0 deposit options are now available from the Deposit section of the website. Gold Card users are now able to edit more account details at the 'My Section' area of the Entropia Universe website.

Technical

- The most common Client Crash causes have been fixed.
- Measures have been carried out to reduce the occurrence of 'loot-lag'.
- Internal technical tasks for the migration of Entropia Universe to the CryENGINE 2 platform have been performed.
- Technical enhancements have been implemented to the Entropia Universe server park to increase up-time even more.

Other Enhancements

- One of the boundary walls around the Port Atlantis bio lab has been adjusted to prevent avatars getting trapped within the complex.
- A bug allowing the instant charging of MindForce chips by initiating the 'sweat' action has been fixed.
- All Weapons Traders now sell TT (Trade Terminal) weapons.
- It is no longer necessary to reequip repaired items, which were below their condition limit and dragged directly from the avatar to the Repair Terminal, in order for their condition to be restored.
- Adjustments to Fort Argus bank to prevent avatars getting stuck in stairs.
- Attachments on other avatars' weapons are now visible to all.
- A 'Confirm' panel has been included for processing 'Estate Maintenance' payments.
- The 'Big Bulk' mob no longer inflicts burn damage.
- Blueprint Books have been recolored to reflect the color of the blueprints they contain.
- Avatar feet are now better positioned when sitting in chairs.
- Flying rocks and dancing trees behave as they should again :)

ENTROPIA UNIVERSE VERSION UPDATE 9.2

2008-01-29

*** PLEASE READ THIS DOCUMENT IF YOU FIND SOMETHING OUT OF THE ORDINARY IN THE ENTROPIA UNIVERSE! IT MIGHT PROVIDE THE INFO YOU NEED BEFORE CONTACTING THE ENTROPIA UNIVERSE SUPPORT DEPARTMENT! ***

VERSION UPDATE FEATURES

CryENGINE2 Update
Currently, about 90% of MindArk's programming resources are allocated to the adaptation process of the CryENGINE2. As a result VU 9.2 only contains minor developments visible to the public.

Three additional programmers have been employed to speed up the adaptation process, while we continue to search and accept applications for further programming positions (visit Mindark.com for more details). These will allow us to continue enhancing existing Entropia systems and develop exciting new content like space travel, exploration and combat once the integration phase is complete.

Material Customization
Texture customization has now been extended to all Customizable (C) items.

Using blueprints and extractors, Material Textures can be manufactured from a range of well known minerals, animal skins, precious stones and more. Using a Texturizer tool, the Material Textures can then be applied to the various fields of Customizable (C) items.

Customizable items' names have been adjusted to reflect a more basic description e.g. Small Wooden Chair is now Small Chair.

For further instructions on how to apply unique Material Textures to Customizable (C) items, please read the Customizing section of the Manufacturing chapter of the Participants Guide.

Beauty

- A low skilled hairstylist can now work on avatars that have high skill hair styles.
- Party eye lenses are available for the best face sculptors.
- A bug fix has resulted a slight change to the most extreme avatar faces. We apologize for any inconvenience caused by this.
- Face skin gloss effect enhanced.
- The red color around avatars' eyes has been reduced.

AI
The Allophyl, Estophyl, Araneatrox and Ambulimax species have been updated with new graphics and shader technology. Their behaviors have mutated in the process.

Creatures with high attack rates have slightly increased 'inflict critical hit' ability.

Market Value
Market value averages and graph calculations for limited items have been modified. Limited item sales are now weighted based on the items TT value to give a more stable market value. As a result, the sales value for limited items and stackables now represents the total sales in PEDs instead of total amount of items. This change applies to all previous sales.

Storage
Storage performance has been improved to reduce storage 'freeze' when opening and loading many items.

Graphics

- All carpets have been redone with real shader settings.
- The icons of several mineral stones have been reduced.
- Ninja High Jacket collar fixed.

Crystal Palace
Creature density has been increased at Crystal Palace.

Hadesheim
A new Repair Terminal has been added close to the Hadesheim C teleporter.

Equipment Blueprints & Books
Equipment blueprints and books have been renamed to Component blueprints and books.

Items
A range of new items have been added and are waiting to be discovered. All mats have now changed names to carpets. To reduce litter, items with a value below 1 PEC cannot be dropped.

Other Enhancements

- The 'Globals' message channel is disabled by default for new arrivals.
- Unresponsive auction when over 25 bids entered has been fixed.
- Auction now correctly numbers bids over 26.
- It is now possible to remove DNA during Land Management process again.
- Land Taxes can be set correctly again.
- Avatar weight is calculated correctly following refining.
- Makeup Increase/Decrease brush size actions fixed.
- Postures can again be set for shopkeepers, mannequins and bank tellers.
- When an item is traded, its desk top item is removed completely.
- Detach Attachments now possible for items in storage.
- Names restored to status bar and target box for fruit, dung and stones.
